Introduction

1.1 Genesis HealthCare System: Genesis Hospital

Genesis HealthCare System (GENESIS) is a family of health care and related organizations, based in Zanesville, Ohio. GENESIS's flagship organization is its not-for-profit hospital, Genesis Hospital in Zanesville, Ohio.

GENESIS is the largest health care provider in its six-county service area of southeastern Ohio, which includes Muskingum, Morgan, Perry, Coshocton, Noble and Guernsey counties. GENESIS provides a higher level of service than what is typically found in a community of its size including: open-heart surgery, Level III trauma care, a Level II neonatal intermediate care unit, neurosurgery, and comprehensive cancer services. This level of care has established GENESIS as a primary referral center for much of the region. GENESIS maintains a steadfast commitment to the delivery of high quality, compassionate patient care and is recognized throughout the country with numerous awards and accreditations. GENESIS is proud of the rich history of serving the community and vows to continue the tradition of healing and caring with compassion, trust, innovation and excellence.

1.2 Mission

The mission of GENESIS is to provide compassionate quality health care. GENESIS conducted its third Community Health Needs Assessment (CHNA) in order to strengthen community involvement in identifying and prioritizing the health needs of the community. The process of completing the CHNA is described below. As part of the CHNA, Genesis conducted an evaluation of the last Implementation Strategy. The results are enclosed in this document in Section 6 as ADDENDUM "Evaluation of Community Benefit Outcomes 2016-2018 Community Benefit Implementation Strategy April 22, 2016". This CHNA is available to the public at www.genesishcs.org.

1.3 Collaboration

Many of the counties in the community have assessment processes and community improvement plans at the county level to address health needs. GENESIS is committed to participating in and supporting these efforts. In addition to county level efforts, GENESIS completed the 2019 CHNA through a collaborative process involving public health personnel, university students, and other key partners. The Community Benefit Committee guided the development of the community and key informant surveys and informed the collection of the surveys. A team of 18 local partners and GENESIS employees formed the Prioritization Group (PG) to review the survey results and the health status data available for the six counties in the Genesis service area. This prioritization process identifies the top health needs in the communities and will inform the development of the 2019-2021 Community Benefit Implementation Plan. A great deal of time and effort from members of the PG was given prior to the meeting of the group in reviewing the survey results and health status data. We would like to thank all of the group members for their work in identifying and prioritizing the health needs of their communities, in particular:

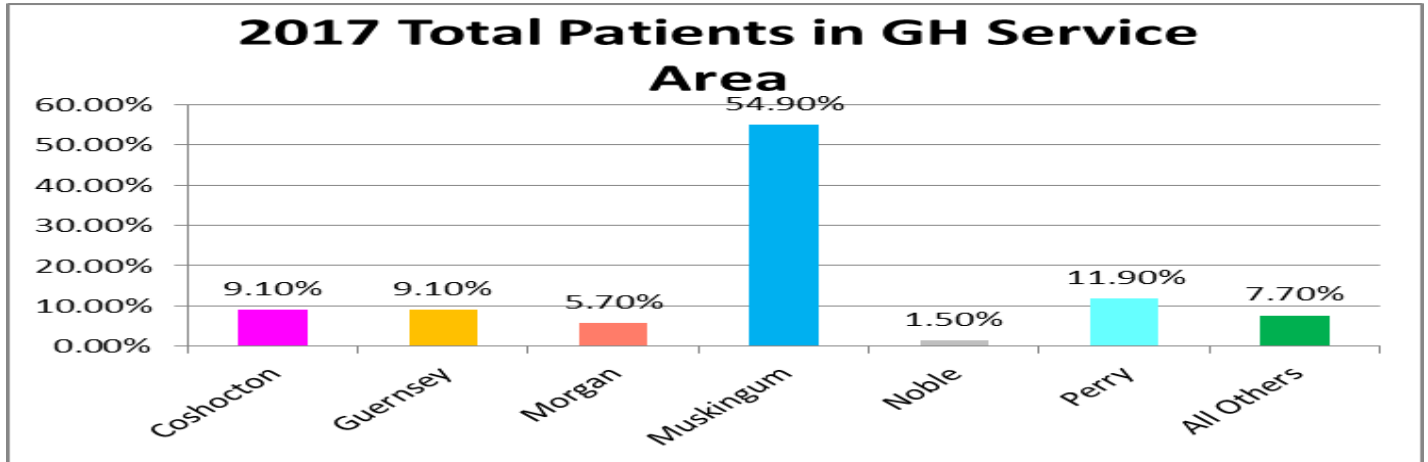

- Zanesville-Muskingum County Health Department
- Noble County Health Department
- Morgan County Health Department
- Muskingum Valley Health Centers
- United Way of Muskingum, Perry and Morgan

- Muskingum University students
- GENESIS Service Line leaders.

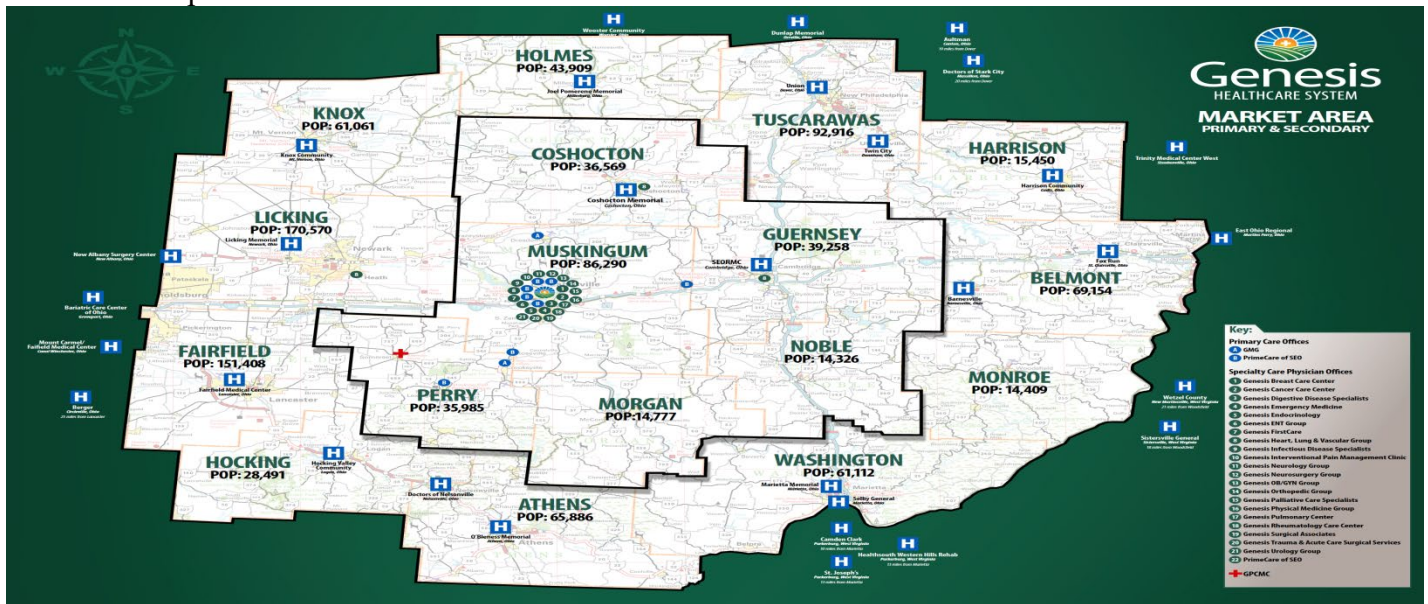

2 Community Description

2.1 GENESIS Hospital Service Area (GHSa)

The community description is defined for the CHNA as the primary service area of GENESIS which includes Muskingum, Guernsey, Noble, Morgan, Perry, and Coshocton counties. The percent of patients in the service area is depicted below by county. As shown in the chart below, 7.7% of patients came from outside the GHSa in 2017.

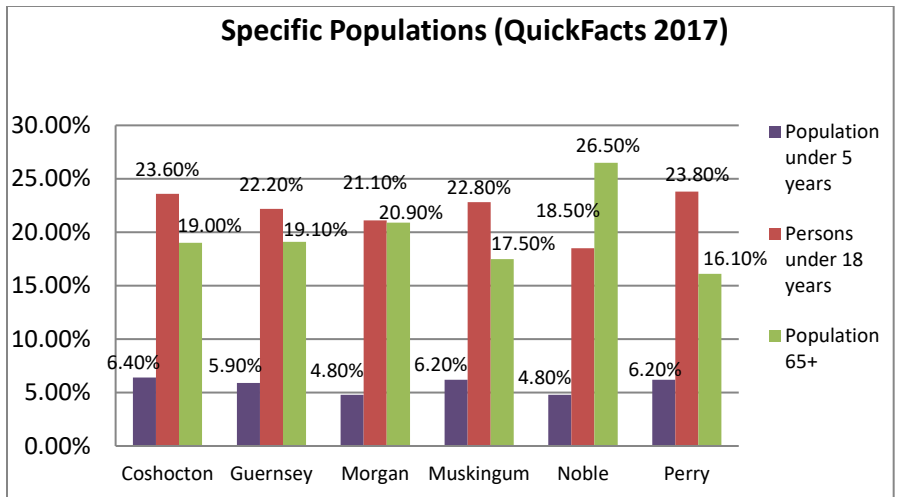

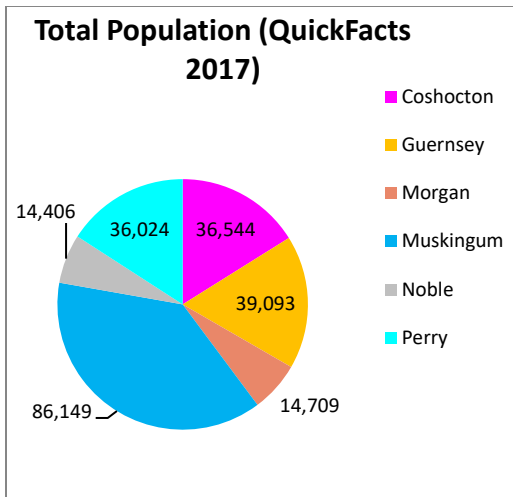

Below is a map of the GHSa.

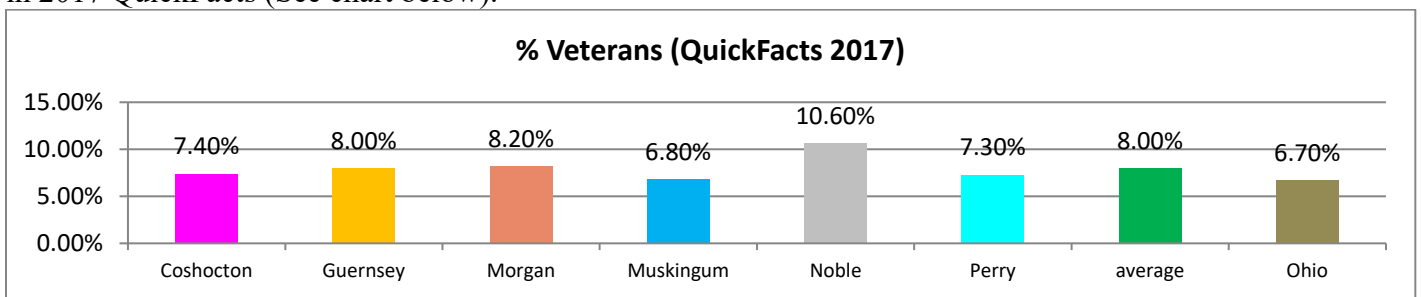

2.2 Population Demographics

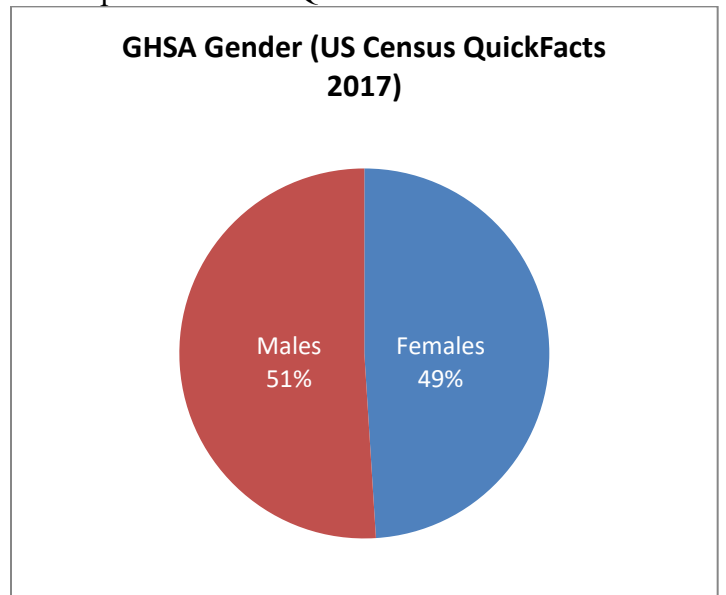

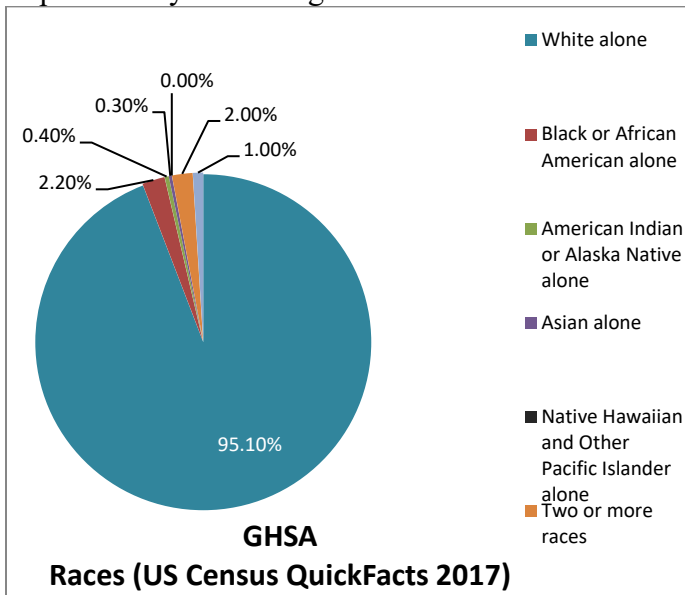

All of the counties in the service area are federally designated as Appalachian counties. Population in the region is concentrated in the cities of Zanesville, Cambridge and Coshocton while all counties are considered rural in Ohio. On the next page are found charts containing demographic information from US Census QuickFacts (QuickFacts) for the GHSa population including total population and specific populations reported in 2017.

Within the GHSA, there is an average of 8% of persons who are veterans compared to 6.7% for Ohio reported in 2017 QuickFacts (See chart below).

Population by race and gender are found in the charts below reported in 2017 QuickFacts.

2.3 Social Determinants of Health for the GHSA

Key social factors affect the health of the community. The 2018 Catholic Health Association of the United States' publication *Healing the Multitudes, Catholic Health Care's Commitment to Community Health 2018* states, "The social determinants of health recognize that health does not exist in a vacuum. The health of every individual is shaped by their physical environment, social and economic conditions, biology and genetics, access to health services, and personal behavior. The social determinants of health are those conditions in which people live, work, and play that can ultimately influence their health."

Appalachian counties historically are more distressed economically. Family incomes are lower and jobs are hard to find. Poverty rates affect community members' ability to eat healthy, get the healthcare they need, and have safe and adequate housing, food and clothing. The poverty rates impact crime, neglect and abuse, education and stress levels. It is important to look at these social determinants for the GHSA to understand the stress and distress on the poor, underserved portion of the community. The following sections will describe the social characteristics of the GHSA broken into the categories of Economic Stability, Neighborhood and Built Environment, and Education.

3.3.1. Economic Stability

3.3.1. A. Housing

Housing characteristics define the stability of where people live in the community. In 2016, the US Census FactFinder (FactFinder) reported an average of 74.6% of people owned their home which was higher than Ohio (66%). Of the homes built before 1980, the GHSA average was 64.3% compared to Ohio at 68%. Although there was slightly less percent of houses built before 1980, of the houses built before 1939 the GHSA average was 28.6% compared to 20.7% for Ohio. Houses built before 1980 are at higher risk of lead and asbestos used in the building process. The average owner costs at 35% or more of the household income was 18.5% compared to Ohio at 18.2% of owners. For those that rent, the average gross rent at 35% or more of the household income was at 38.8% for the GHSA compared to Ohio at 39% (See Appendix 5.2 Chart 8 page 50).

3.3.1. B Food Security

Of those persons living in poverty, they are at risk of food insecurity. To combat this problem the federal government provides programs and the emergency food system that provides a comprehensive nutrition safety net reaching food insecure individuals at different income levels and in different settings. Child nutrition programs, in particular, plays a critical role in providing quality nutritious meals to millions of children every day for free or at a reduced cost. In 2016, Feeding America Map the Meal Gap reported the average GHSA adult food insecurity for the broad community at 15.2% with Ohio at 15.1% (See Appendix 5.2 Chart 9 page 50).

For the GHSA, an average of 23.6% of children was food insecure while Ohio was at a lower 20.3% (See Appendix 5.2 Chart 10 page 50).

3.3.1. C. Employment

Persons are classified as unemployed if they do not have a job, have actively looked for work in the past four weeks, and are currently available for work. Within the past six years, the unemployment rates have risen and then fallen in the GHSA. The counties' economies are slowly recovering from a downward spiral. County Health Rankings (CHR) reported in 2018 the Ohio unemployment rate was 4.9%. Despite this decrease in unemployment, all GHSA counties still had a higher percent unemployed than Ohio (See Appendix 5.2 Chart 3 page 48).

3.3.1. D Income

Income

The median household income is used to gauge the health of the economy in the GHSA. QuickFacts reported from 2012-2016 the national average median household income was \$55,322 and Ohio's household median income was \$50,674. All of the counties in the GHSA had the median household income that fell below the Ohio value (See Appendix 5.2 Chart 1 page 47).

There is a list of the major employers for each county reported in the 2018 Ohio Office of Research County Profiles. GENESIS was the largest employer in the GHSA (See Appendix 5.2 Chart 2 page 47).

Poverty

A set of money income thresholds are used in order to determine who is in poverty. If a family's total income is less than the family's threshold, then that family and every individual in it are considered in poverty. The QuickFacts reported from 2012-2016 that a GHSA average of 16.2% of persons below poverty level was higher than the Ohio value at 14%. Five out of six counties in the GHSA were over the Ohio level (See Appendix 5.2 Chart 4 page 48).

According to a study at the UC Davis Health System in 2011 of 12,000 participants over ten years, people with lower socioeconomic status had a 50 percent greater risk of developing heart disease than other participants (<http://www.ucdmc.ucdavis.edu/publish/news/newsroom/5660>). Living below poverty level puts persons at two times the risk of heart disease.

Children living in poverty are of great concern to the community. The 2018 CHR reported there was a GHSA average of 23% of children living in poverty which was higher than 20% for Ohio (See Appendix 5.2 Chart 5 page 49).

FactFinder reported from 2012-2016 for female householders with children under the age of 18, a GHSA average was 48.9% were below poverty level compared to 44.4% for Ohio (See Appendix 5.2 Chart 6 page 49).

FactFinder reported from 2012-2016 a GHSA average of 19.9% of persons were age 65 years and over (Ohio 16.7%). A GHSA average of 9.5% of those 65 and over live in poverty which was higher than Ohio at 8.1% (See Appendix 5.2 Chart 7 page 49).

3.3.2. Neighborhood and Built Environment

3.3.2. A. Crime and Violence

Crime

CHR reported in 2018 the GHSA average violent crime rate of 121 per 100,000 was lower than Ohio at 290 per 100,000 (See Appendix 5.2 Chart 11 page 51).

The GHSA had an average lower rate of adolescents adjudicated for felonies of 1.5 per 1,000 than Ohio (1.8) as reported by 2016 Kids Count Data Center (See Appendix 5.2 Chart 12 page 51).

Unfortunately both the GHSA average violent crime rates and adolescents adjudicated for felonies rates have increased. Crimes related to drugs are a growing problem for the GHSA. The GHSA average rate per 10,000 drug possession charges from 2012-2014 increased by 96.6%. The GHSA average incarceration rate per 10,000 for drug offenses increased by 67.4%, while Ohio increased by 4.9% from 2013-2015 according to the Ohio Mental Health and Addiction Services (OMHAS).

Neglect and Abuse

According to data from Kids Count Data Center (KCDC), the GHSA average number of children neglected and abused has decreased from 92.8 to 77.7 from 2013-2016 while the Ohio number decreased from 20,236 to 17,687. The GHSA average rate of neglect and abuse per 1,000 children was 7.8 in 2016, which was higher than Ohio (6.8).

3.3.2. B. Transportation

In the GHSA, there is an average of 85% who drove alone to work reported in 2018 from CHR, versus 83% for Ohio (See Appendix 5.2 Chart 13 page 51).

Those who drove alone with a long commute in the GHSA average 37% was higher compared to 30% in Ohio as reported by CHR 2018 (See Appendix 5.2 Chart 14 page 52).

Chart 15 on page 52 shows the difference between the GHSA and Ohio for types of transportation used as reported by FactFinder 2016. In the GHSA less drive alone, more carpool, less use public transportation, more walk, more use other transportation and more work at home than for Ohio.

3.3.2. C. Clean Air and Water

Clean air and water are two factors that help define the environment which people live, work, and play. Air pollution was measured by the air particulate matter days and the GHSA had an average of slightly less days at 11.2 than Ohio at 11.3 as reported by 2018 CHR (See Appendix 5.2 Chart 16 page 52).

At least one drinking water violations was noted in three of the six counties for the GHSA as reported by 2018 CHR (See Appendix 5.2 Chart 17 page 53).

3.3.3. Education

3.3.3. A. Early Childhood Education

Two indicators of success in grade school are reading and math proficiency. According to KCDC from 2016-2017 for 4th graders in the GHSA, there was an average of 60.1% proficient in reading compared to Ohio at 62.8%. According to KCDC from 2016-2017 for 4th graders in the GHSA, there was an average of 71.7% for proficiency in math compared to Ohio at 72.4% (See Appendix 5.2 Charts 18 and 19 page 53). With both of these indicators, over 25% of 4th graders were not proficient in reading and math.

3.3.3. B. High School Graduation and Some College

The GHSA area had a higher percentage of high school graduates (89%) than Ohio (81%), but four of the six counties decreased in the percentage of high school graduates as reported by 2018 CHR. For the percentage of persons with some college, the GHSA average of 47% was significantly lower than Ohio at 65% as reported by 2018 CHR (See Appendix 5.2 Charts 20 and 21 page 54).

3.3.4. Social Services Resources

Assets were mapped for all the social services resources available in each county of the GHSA. These services include resources for food, clothing, housing, abuse, legal help, children, employment, seniors, Veterans, transportation and more. The listing of these social service resources by county is available in the Section 5.2 of the Appendix page 41-47.

3 Process and Methods

3.1 Prioritization Group

A Prioritization Group (PG) was created for the purpose of identifying and prioritizing the needs documented in this report.

4.1.1. PG Members and Experience:

- Special knowledge of or expertise in public health:
 - ✓ Kylie Jones, Community Health Planner, Zanesville Muskingum County Health Department (ZMCHD)
 - ✓ Diana Zaato, Epidemiologist, ZMCHD
 - ✓ Rebecca Aber, Morgan County Health Department
 - ✓ Samantha Hesson, Noble County Health Department
 - ✓ Angie Feldner, Noble County Health Department
- Special knowledge of medically underserved, low income and minority populations:
 - ✓ Meg Dedrick, Director, United Way of MPM
 - ✓ Kylie Emmert, Quality Improvement, Muskingum Valley Health Centers
 - ✓ Sister Maureen Anne Shepard, Director of Mission, GENESIS
 - ✓ Jody Stones, Community Benefit Consultant, Mission, GENESIS
- Special knowledge of GENESIS chronic disease needs, injuries, and maternal and child needs:
 - ✓ Mary Kitzig, Director of Population Health and Wellness
 - ✓ Keela Barker, Director of Neuroscience Services
 - ✓ Tabitha McKenzie, Director of Heart, Lung and Vascular Services
 - ✓ Sue Hoover, Director Women's and Children's Services
 - ✓ Tisha Babcock, Director Pulmonary Services and Critical Care
 - ✓ Denise Williams, Manager Behavioral Health
 - ✓ Jodi Lee, Director of Cancer Services
 - ✓ Linda Bowers, Community Relations Coordinator, Marketing and Public Relations
- Special thanks for data collection:
 - ✓ Alexandra Carson, Student Intern, Muskingum University, New Concord
 - ✓ Allison Guckes, Student Intern, Muskingum University, New Concord
 - ✓ Shelbie Wiseman, Student Intern, Muskingum University, New Concord.

4.2 Community Input

A Community Health Survey was conducted. The survey gathered the community input on their priorities for chronic conditions, risks associated with chronic conditions, mothers, children, and infants, and access to care. The survey was collected on the Genesis website in May of 2017 and used Facebook and newsletters to publicize the Community Health Needs Survey. A total of 158 surveys were collected. Surveys were completed on the Genesis website. Surveys were also collected by three Muskingum University students from individuals waiting for services at the Genesis Hospital, in underserved locations, and at local community sites where many people gather. All six counties were represented in the survey. Underserved sites where surveys were collected included Muskingum Valley Health Center, the Veteran's Clinic, Salvation Army, and Christ's Table. 22 persons completed the survey in the underserved locations. 36 Key Informant Surveys were collected in the community and contained categories for chronic conditions, risks associated with chronic conditions, mothers, children, and infants, and access to care. Special care was used to identify key informants with knowledge of uninsured persons, low-income persons, and minority groups. In addition, we have identified the key informants specifically as: (1) persons with special knowledge or expertise in public health; (2) representatives from government or public health departments; and (3) leaders, representatives, or members

of medically underserved, low income, and minority populations, and populations with chronic disease needs. All six counties were represented in the Key Informant Survey.

GENESIS received no public comments on the last CHNA report which has been posted on the web over the last three years. Many community partners reviewed it and used the information.

In addition to using county based needs assessments, due to the large community defined in this community health needs assessment, special care was taken to incorporate the views of key informants from each county. Below are examples of the agencies and groups completing the Key Informant Survey.

4.2.1. Coshocton

- Genesis HealthCare System
- Allwell Behavioral Health Services
- Mental Health Recovery & Services Board

4.2.2. Guernsey

- Genesis HealthCare System
- Allwell Behavioral Health Services
- Mental Health & Recovery Services Board
- Muskingum Valley Health Center

4.2.3. Morgan

- Genesis HealthCare System
- Allwell Behavioral Health Services
- Mental Health & Recovery Services Board
- Morgan Behavioral Health Choices
- United Way of Muskingum, Perry and Morgan Counties
- Muskingum Valley Health Center

4.2.4. Muskingum

- Genesis HealthCare System
- The Carr Center
- Zanesville-Muskingum County Health Department
- United Way of Muskingum, Perry and Morgan Counties
- Rambo Memorials Health Center
- Muskingum Valley Health Center
- Allwell Behavioral Health Services
- Mental Health & Recovery Services Board
- Muskingum Behavioral Health
- West Ohio Methodist Conference

4.2.5. Noble

- Genesis HealthCare System
- Allwell Behavioral Health Services
- Mental Health & Recovery Services Board

4.2.6. Perry

- Genesis HealthCare System

- Allwell Behavioral Health Services
- Mental Health & Recovery Services Board
- United Way of Muskingum, Perry and Morgan Counties
- Perry Behavioral Health Choices, Inc.

4.3. Identifying Health Problems and Needs

The PG utilized the data elements identified through secondary data provided by state, national and local sources to define health status; the results of the Community Health Survey; and the results of the Key Informant Survey to form the basis for a prioritizing session. The members of the PG met on September 20th, October 3rd, and October 23rd, 2018 to use a voting matrix to prioritize the assessment data. The following key data were part of the matrix:

4.3.1. Chronic Conditions

- Heart disease
- Cancer
- Chronic lung conditions
- Unintentional injuries/accidents
- Alzheimer's disease
- Strokes
- Addictions/Mental Health

4.3.2. Risks Associated with Chronic Conditions

- Overweight/obese-BMI over 30
- Diabetes
- High cholesterol
- Tobacco
- Lack of sleep
- Access to healthy foods
- Physical Inactivity
- Cancer screening
- Black Lung
- Asthma
- Motor vehicle accidents
- Poisoning
- Violence
- Suicide
- Firearms
- Work related injuries
- Falls
- High blood pressure
- Opioid use
- Neonatal Abstinence Syndrome in babies
- Mental health provider ratio

- Alcohol overuse
- Communicable diseases

4.3.3. Mothers and Children

- Low birth weight
- Pre term babies
- Unwed births
- Childhood lead poisoning
- Teen births
- Children with special health care needs
- First trimester prenatal care

4.3.4. Access to Care

- Uninsured children
- Uninsured adults
- Primary care physician ratio
- Dentist ratio

4.4 Identify and Document Information Gaps

GENESIS had limited resources to complete a large number of Community Health Surveys in counties surrounding Muskingum County. With limited community input from these counties, it is harder to assess their individual county level needs for the CHNA. There was some county level data available through the electronic medical record system administered by GENESIS which included high blood pressure, high cholesterol, and diabetes. Each year more data will become available through the electronic medical record system.

Most health status data that revealed local burden levels of chronic diseases, risks associated with chronic conditions, issues related to the health of mothers, children and infants, and access to care was dependent on self-reported data from state phone surveys.

4.4.1. Prioritization Group Process Based on Established Criteria:

The Prioritizing Group met twice to review available data and benchmarks, key informant interviews, surveys and all available county needs assessments. A ranking of 1 to 5 was used when voting on five criteria per key data element. Below are the criteria and the scale of 1 to 5:

- A. **Burden/Scope:** what is the level of health risk for those in our community; how many people in the service are affected by the health issue
 - a. **Ranking:**
 - i. 1. Means highest level of health risk and most people affected by this health issue
 - ii. 2. Means high level of health risk and many people affected by this health issue
 - iii. 3. Means neutral/average
 - iv. 4. Means low level of health risk and some people affected by this health issue
 - v. 5. Means lowest level of health risk and least people affected by this health issue
- B. **Urgency:** is this a severe problem, needs urgent attention
 - a. **Ranking:**
 - i. 1. Means most severe problem that needs immediate attention
 - ii. 2. Means severe problem that needs attention

- iii. 3. Means neutral/average
 - iv. 4. Means less severe problem that needs some attention
 - v. 5. Means least severe problem that needs least attention
- C. **Feasibility/Resources:** can we improve the burden of this health issue in the next 3 years; are resources available to address this health issue
- a. **Ranking:**
 - i. 1. Means most resources available to improve this health issue
 - ii. 2. Means many resources available to improve this health issue
 - iii. 3. Means neutral/average
 - iv. 4. Means less resources available to improve this health issue
 - v. 5. Means least resources available to improve this health issue
- D. **Disparity:** there is a higher level of this health issue and less resources to address this issue for the vulnerable; underserved/poverty; those of a certain race, age, gender, culture; those with disabilities; etc.
- a. **Ranking:**
 - i. 1. Means highest level for this health issue and least resources for specified populations
 - ii. 2. Means high level for this health issue and little resources for specified populations
 - iii. 3. Means neutral/average
 - iv. 4. Means low level for this health issue and more resources for specified populations
 - v. 5. Means lowest level for this health issue and many resources for specified populations

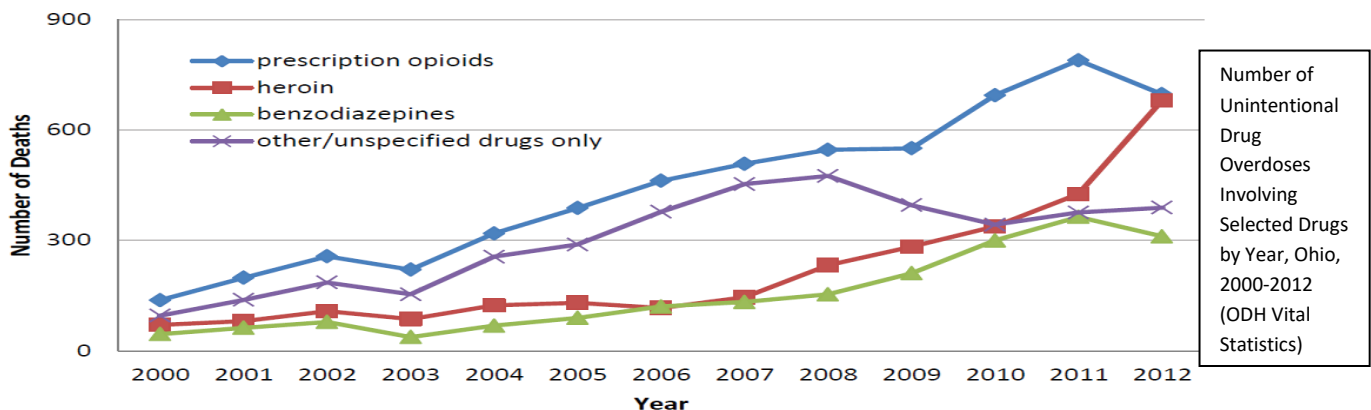

The scores were compiled to identify the top health conditions, risk factors or behavioral risks, issues for women, children and infants, and access to care issues. The next four sections will describe these top issues for the GHSA community members, leaders and Genesis Hospital.

4.4.2. The Top Priority Chronic Conditions

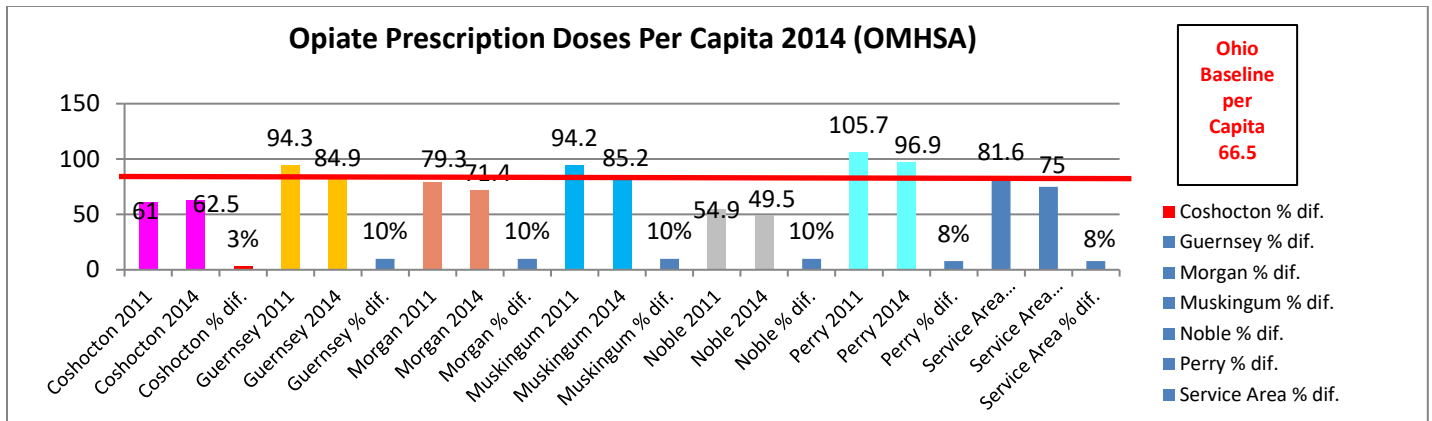

Based on the combined member scores from the prioritization process, the following are the top chronic conditions.

4.4.2.A. Chronic Condition Priority 1: Addictions/Mental Health

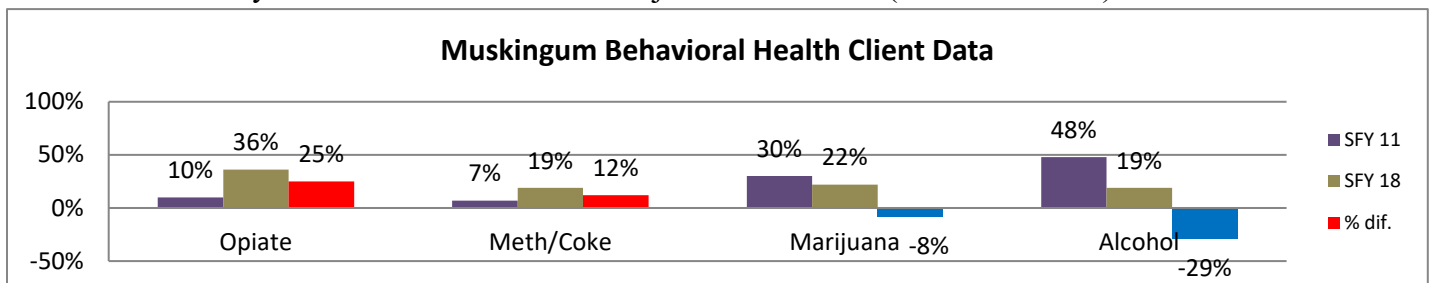

One in four Americans experiences a mental illness or substance abuse disorder each year, and the majority also has a co-morbid physical health condition. **Over 60 overdoses have been documented per month in the GENESIS Emergency Room since January of 2018.** According to Ohio Department of Health (ODH), in Ohio, overdoses deaths sky-rocked from 2000-2011 and started a downward turn as people shifted to heroin (See chart below).

Opioid prescription doses per capita from 2011-2014 (Office of Mental Health and Substance Abuse-OMHSA) in the GHSA had decreased by 8% (See chart below). The GHSA was higher than Ohio for opiate prescription doses per capita in four of six counties, but as evidenced in the chart above, heroin use is taking its place.

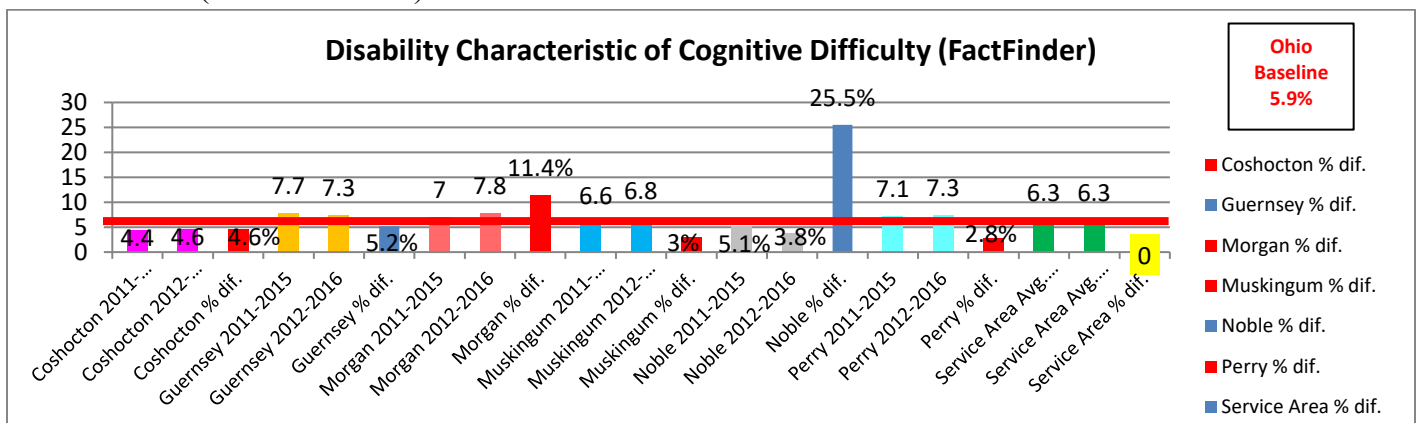

Muskingum Behavioral Health reported that from 2011 to 2018 there had been an increase in opiate and meth/cocaine use by clients and a decrease in marijuana and alcohol (See chart below).

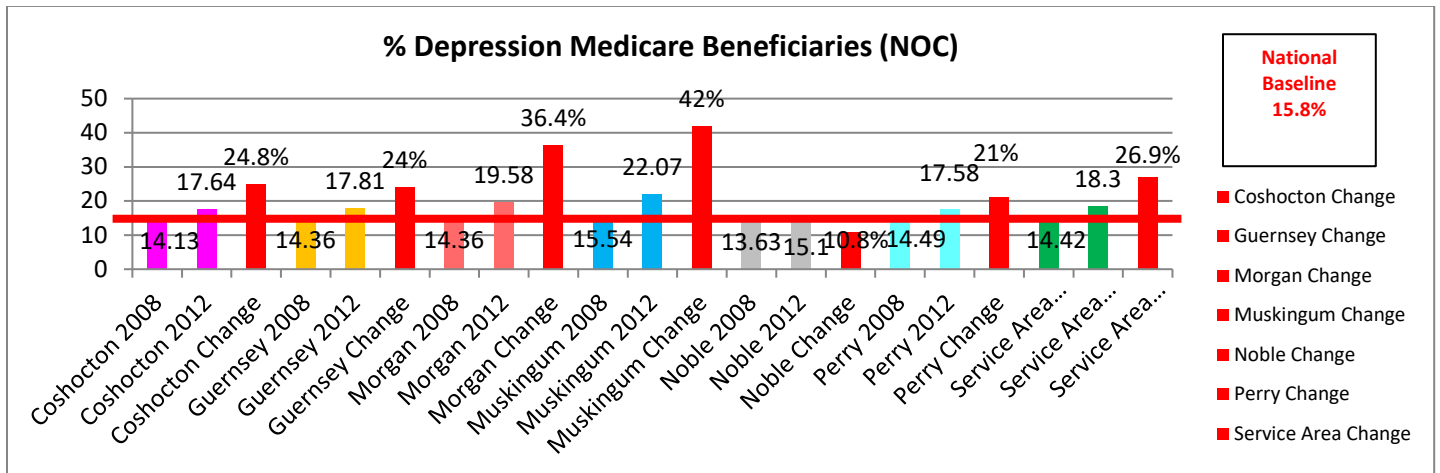

Along with addictions, there are many other mental health issues for the GHSA. Those with cognitive difficulties are part of the picture of this burden. For Muskingum Valley Health Center’s Mental Health Services they see 15,581 clients annually and below are the diagnoses.

- Alcohol related disorders .5%
- Other substance related disorders (excluding tobacco use disorders) 13.8%
- Depression and other mood disorders 29.5%
- Anxiety disorder including PTSD 10.7%
- Attention deficit and disruptive disorders 4%
- Other mental disorders (excluding drug or alcohol dependence) 38%

According to 2012-2016 FactFinder, an average of 6.3% for the GHSA had cognitive difficulties compared to 5.9% for Ohio (See chart below).

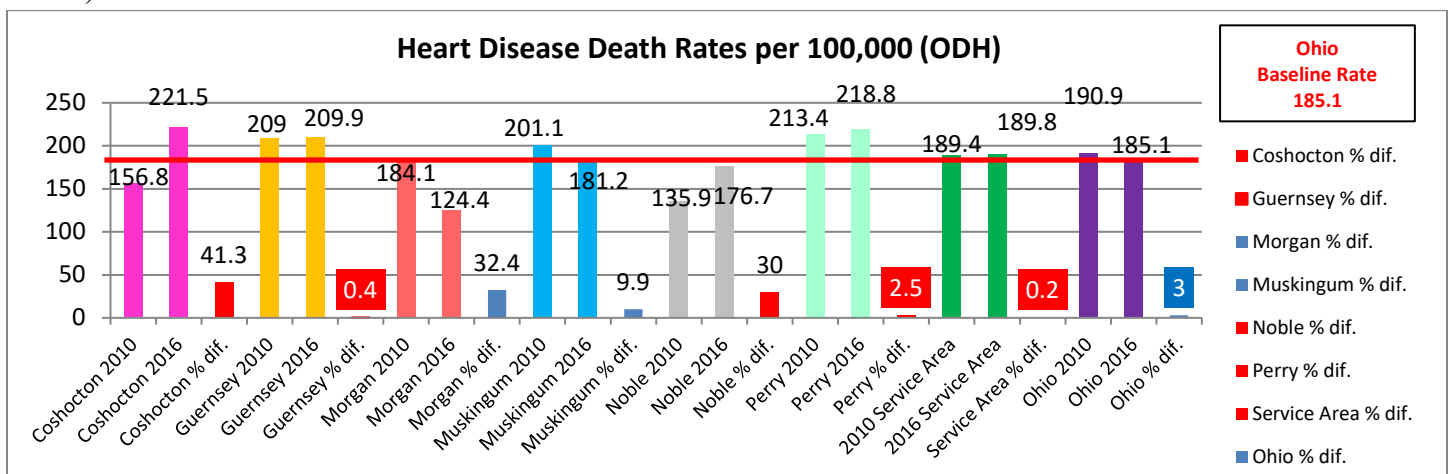

Depression is a portion of the burden of mental illnesses. According to 2012 Network of Care (NOC) Depression diagnoses affected a GHSA average of 18.30% of Medicare beneficiaries compared to 15.8% for Ohio (See chart below).

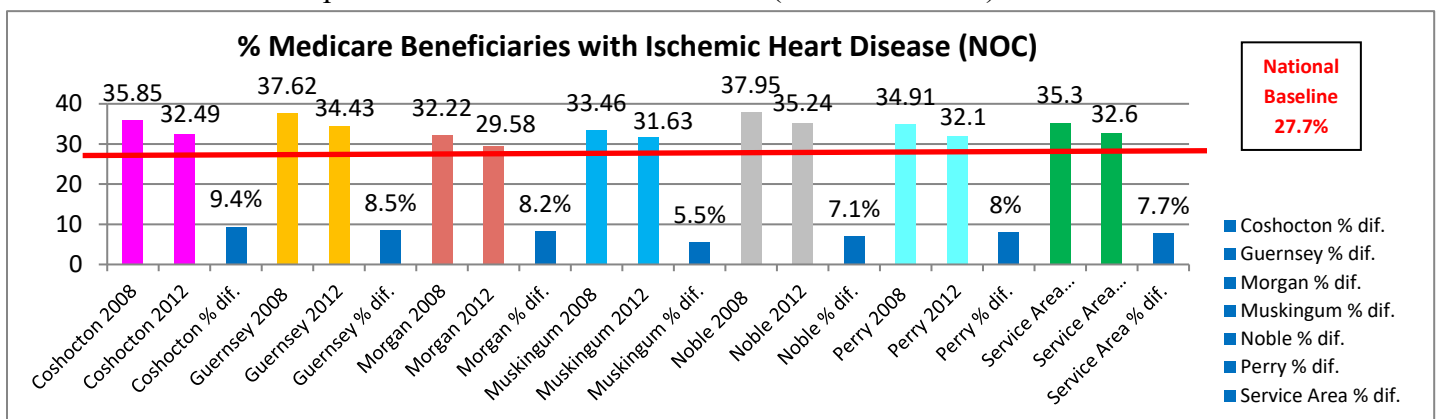

4.4.2.B. Chronic Condition Priority 2: Heart Disease

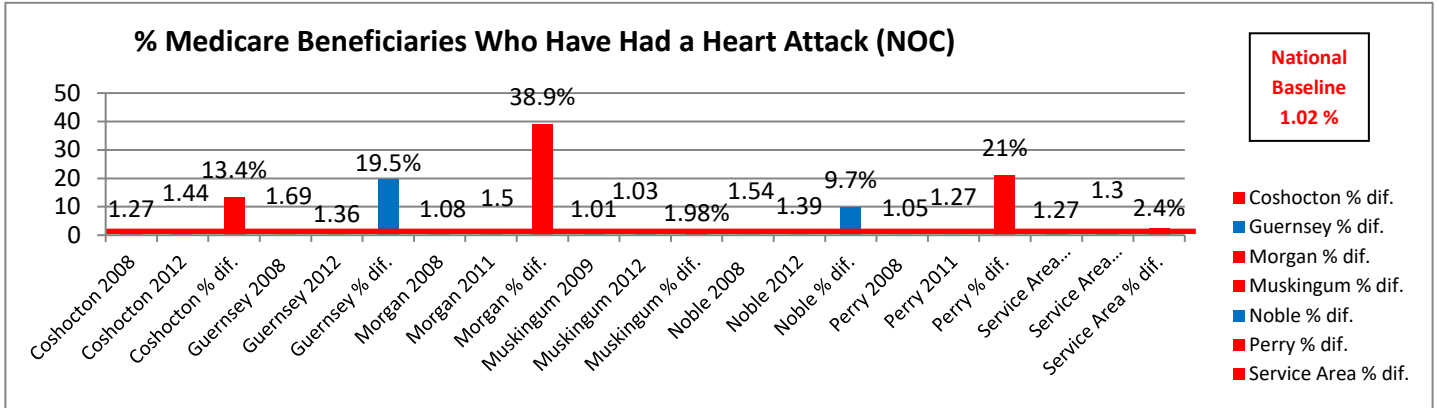

Heart disease was the number one leading cause of death in the GHSA and the number one leading cause of death in Ohio with an average for GHSA a rate of 189.8 compared to Ohio (185.1) according to 2016 ODH. Muskingum, Noble, and Morgan counties rates are lower than Ohio with the other three higher (See chart below).

Ischemic heart disease was an underlying factor for heart disease. Heart disease was a direct cause of heart attacks. According to 2012 NOC, for those 65 and older, the risk of ischemic heart disease was higher in the GHSA than the national percent for Medicare beneficiaries (See chart below).

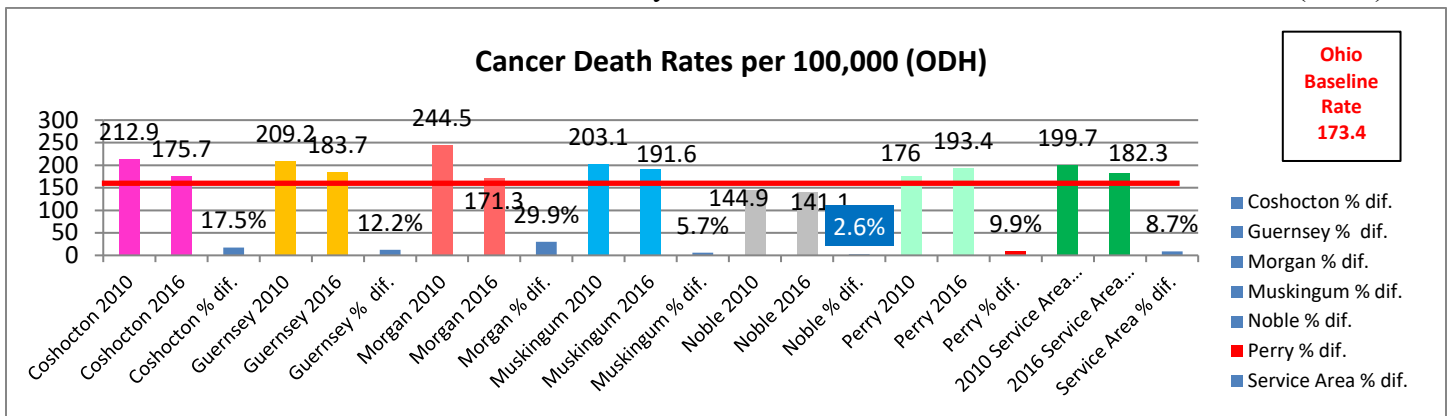

According to 2012 NOC, for those 65 and older, the percent of those who had a heart attack was higher in the GHSA than the national percent for Medicare beneficiaries (See chart below).

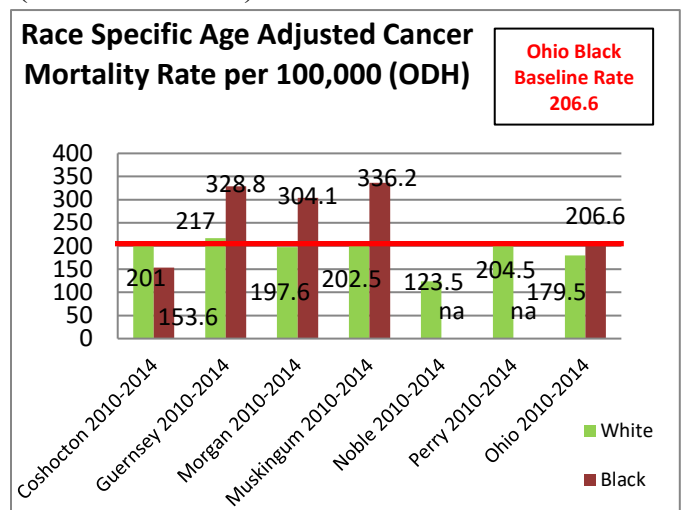

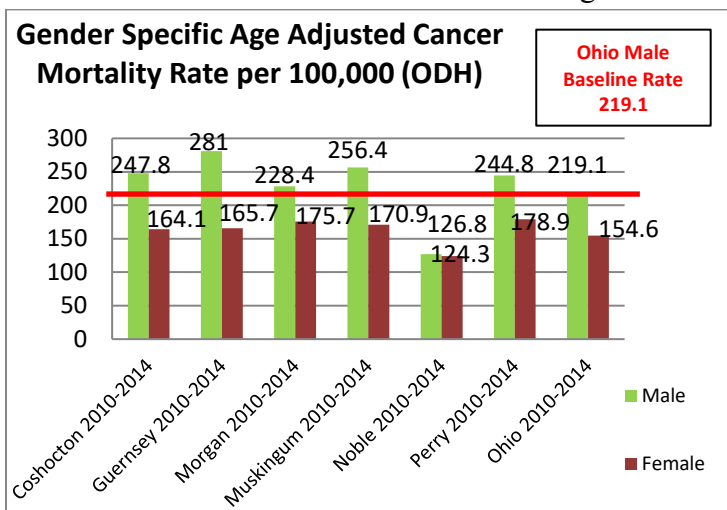

4.4.2.C. Chronic Condition Priority 3 (Tied): Cancer

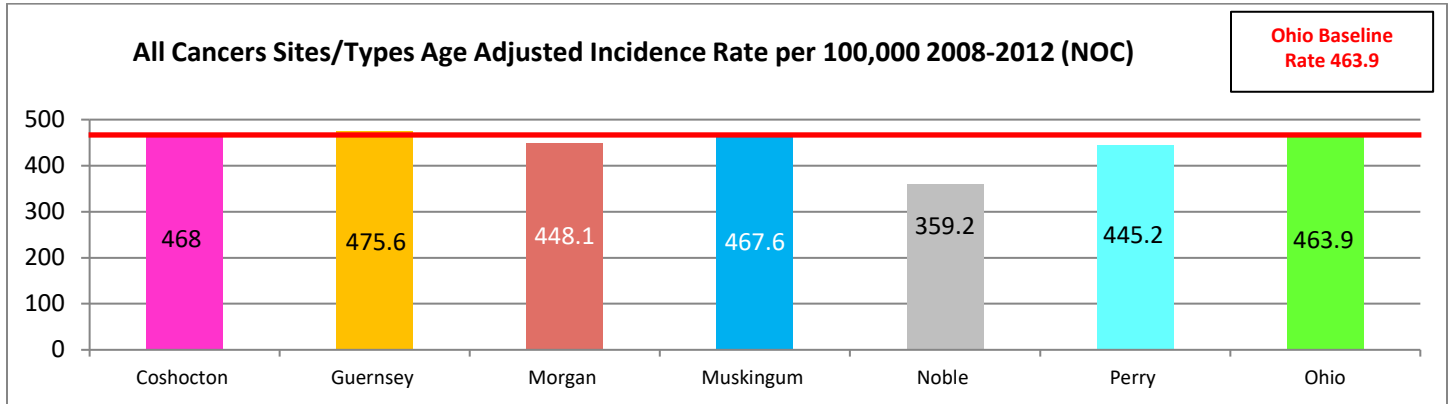

Cancer was the GHSA second leading cause of death and the Ohio second leading cause of death according to 2016 ODH. Four out of six counties in the GHSA had higher rates than Ohio for cancer deaths. The average GHSA rate of 182.3 is higher than Ohio at 173.4 (See chart below). “Cancer is not one disease but many; there are more than a 100 different kinds of cancer, many of which have different causes and risk factors” (ODH).

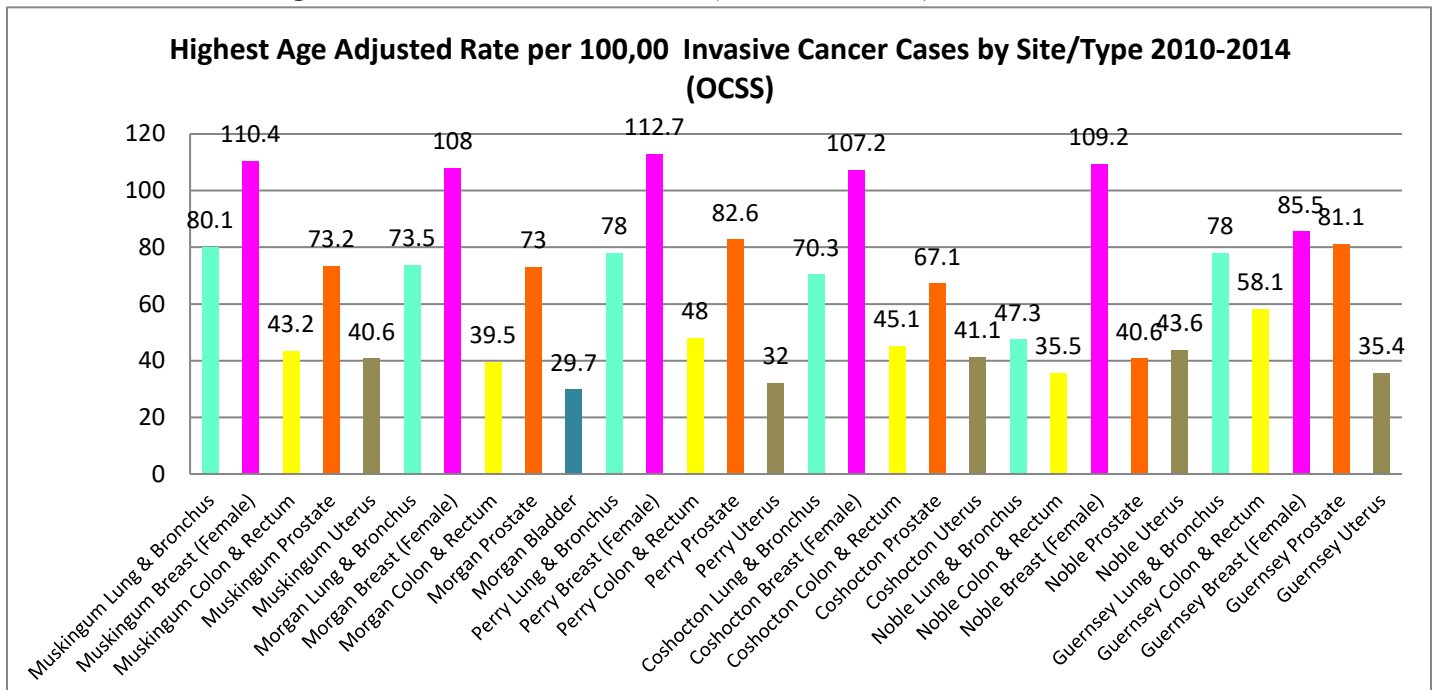

According to 2010-2014 ODH, all six GHSA counties had higher age adjusted cancer mortality rates for males than females. Blacks had higher age adjusted cancer mortality rates than whites in three out of six counties and for those three counties the rates are much higher than Ohio (See charts below).

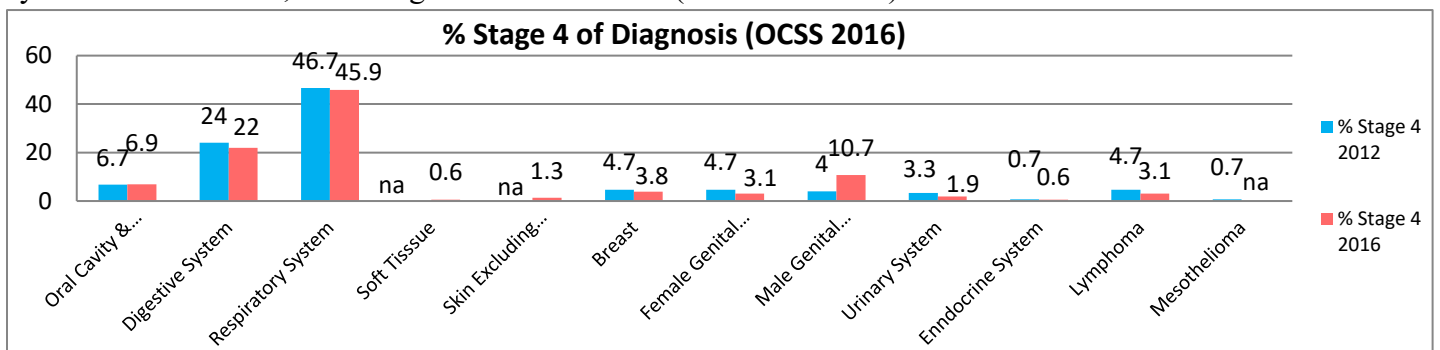

The chart below reveals the incidence rates for all cancers sites and types age adjusted in the GHSA according to 2008-2012 NOC. Three out of six counties had a higher rate than Ohio.

All six counties in the GHSA had the highest rate of invasive cancer cases for breast cancer according to the 2010-2014 Ohio Cancer Surveillance System (OCSS). The second highest rate in four out of six counties was for invasive cancer cases for lung and bronchus cancer. Prostate cancer was the second highest rate in Guernsey and Perry counties. Colon and rectum cancer was the fourth highest rate in all six counties. Uterine cancer was the fifth highest rate in five of six counties (See chart below).

The highest % of Stage 4 diagnosis was respiratory system followed by digestive system and male genital system for the GHSA, according to the 2016 OCSS (See chart below).

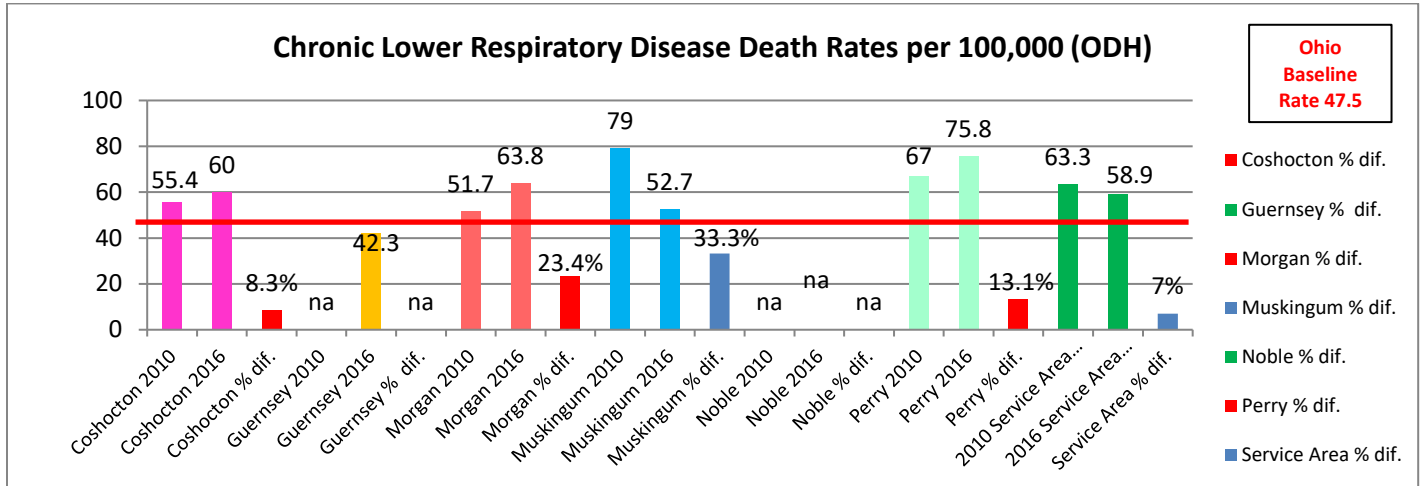

4.4.2. D. Chronic Condition Priority 3 (Tied): Chronic Lung Conditions

Major conditions that can cause chronic lung conditions include chronic lower respiratory diseases (CLRD), asthma, and Black Lung.

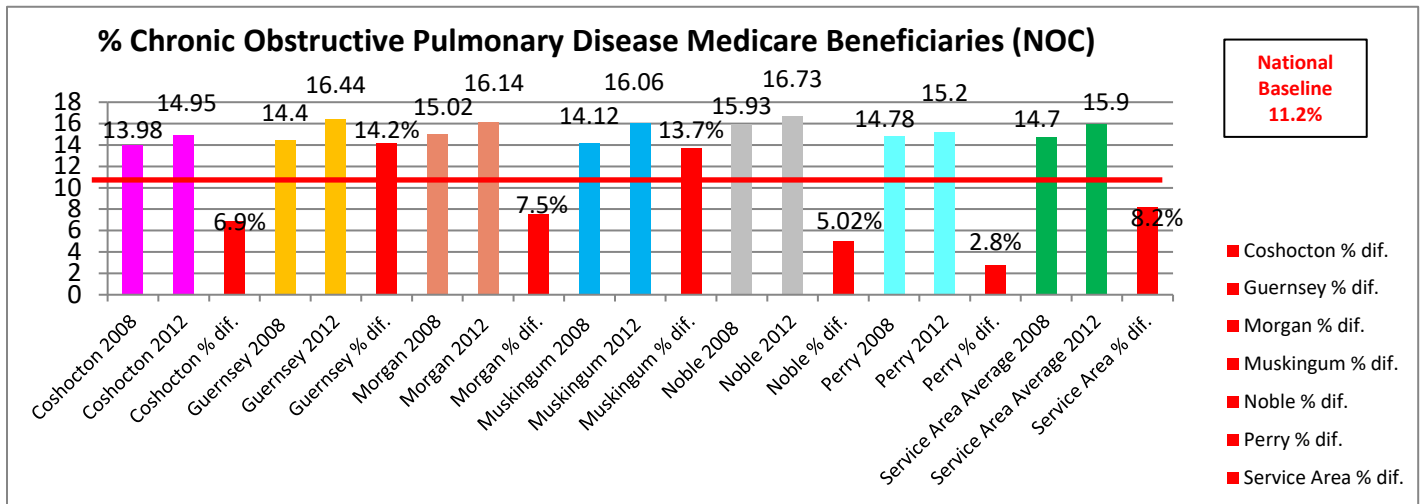

Chronic Lower Respiratory Diseases

According to 2016 ODH, the number three leading cause of death in the GHSA was CLRD. The GHSA average rate of CLRD deaths was higher at 58.9 than Ohio at 47.5 (See chart below).

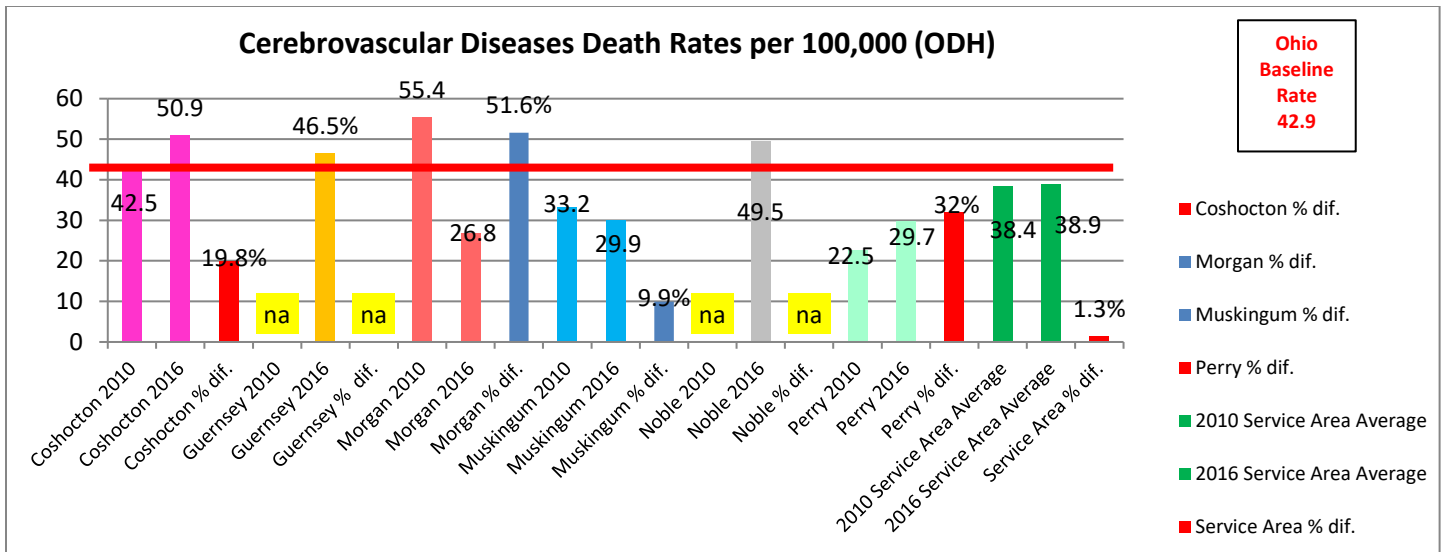

Chronic Obstructive Pulmonary Disease

The GHSA average 15.9% of Medicare beneficiaries with chronic obstructive pulmonary disease was higher than the national 11.2%, according to 2012 NOC (See chart below).

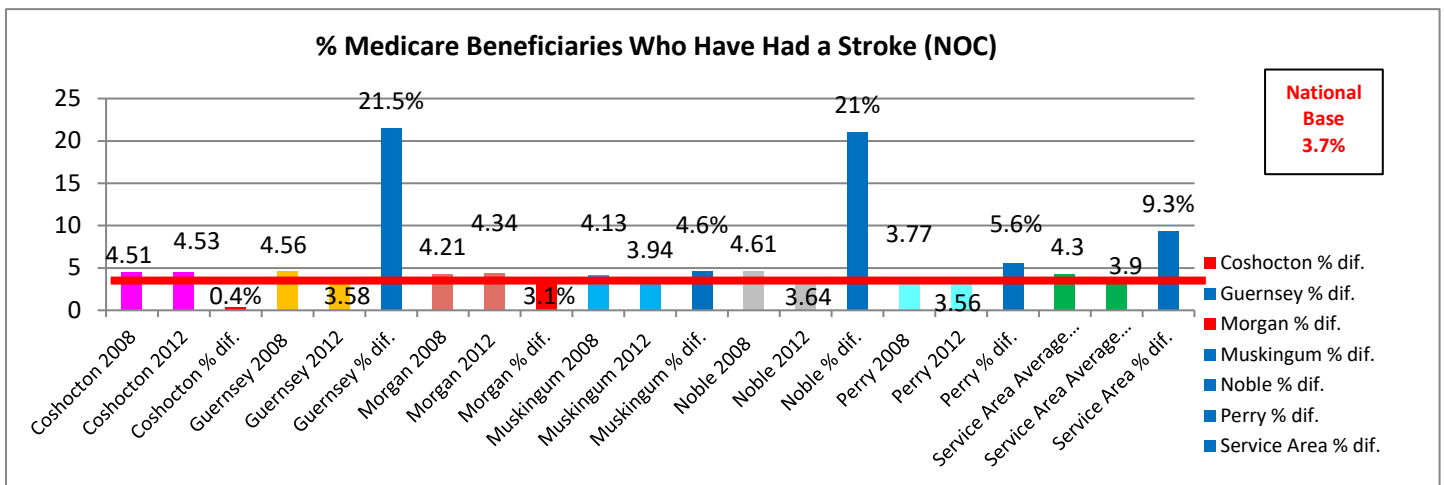

4.4.1. E. Chronic Condition Priority 4: Strokes

According to 2016 ODH, strokes are the sixth leading cause of death for the GHSA. The GHSA average rate, 38.9/100,000, was lower than Ohio (42.9). Coshocton and Morgan counties were higher than the other counties (See chart on the next page).

Strokes and Medicare Beneficiaries

The GHSA average 3.9% of Medicare beneficiaries who had a stroke was higher than the national 3.7%, according to 2012 NOC (See chart below).

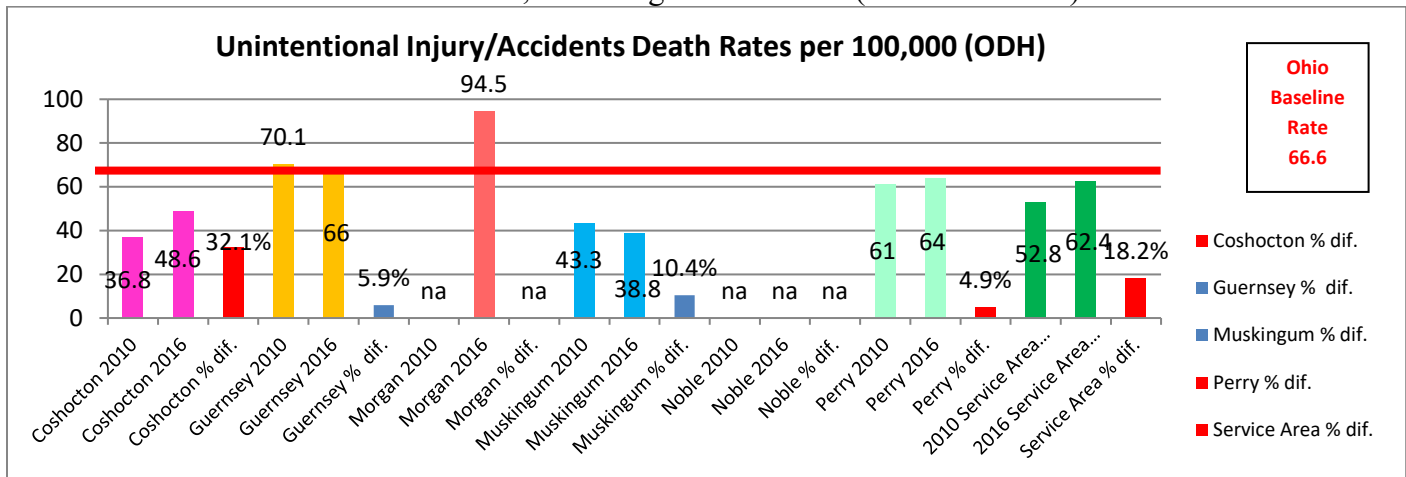

4.4.1.F. Chronic Condition Priority 5: Unintentional Injuries/Accidents

ODH reported from 2006-2009 the leading causes of injury death by age group for Ohio (See chart below).

Age Group	1st-leading Cause	2nd-leading Cause
< 1 year	Suffocation	Homicide
1 to 4	Homicide	Drowning
5 to 9	Motor vehicle traffic	Homicide
10 to 14	Motor vehicle traffic	Suicide
15 to 19	Motor vehicle traffic	Suicide
20 to 24	Motor vehicle traffic	Suicide
25 to 34	Overdose	Suicide
35 to 44	Overdose	Suicide
45 to 54	Overdose	Suicide
55 to 64	Suicide	Motor vehicle traffic
65 to 74	Falls	Suicide
75 to 84	Falls	Motor vehicle traffic
85+	Falls	Not specified
All ages	Drug Overdose	Suicide

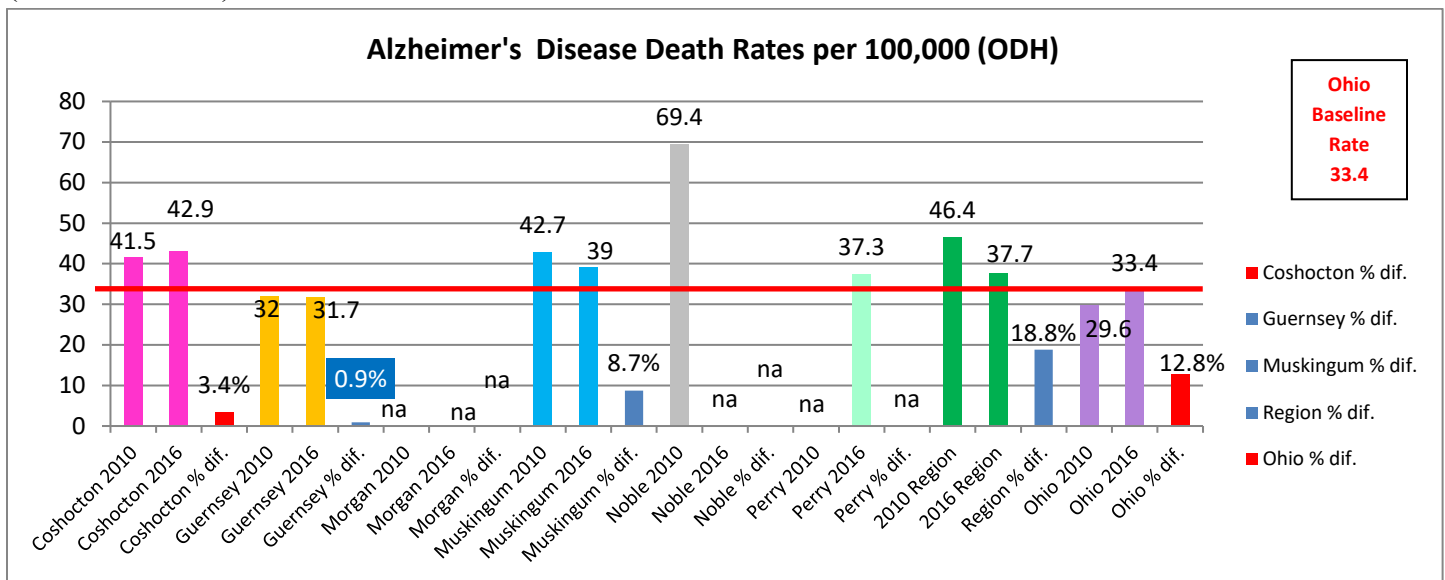

Source: ODH Vital Statistics

Unintentional injuries/accidents were the fourth leading cause of death in the GHSA. The GHSA average death rate of 62.4 was lower than Ohio at 66.6, according to 2016 ODH (See chart below).

4.4.1.F. Chronic Condition Priority 6: Alzheimer's Disease

Alzheimer's disease—a progressive and fatal condition in which cells in certain parts of the brain are destroyed—creates severe problems in memory, judgment, ability to organize simple tasks and even speech. The most common form of irreversible dementia, the condition has no cure or even disease-modifying treatment. According to 2016 ODH, this condition was the number six average cause of death for the GHSA (See chart below).

Nationally, an estimated 5.3 million Americans have Alzheimer's disease in 2015. Age was the single greatest risk factor for the disease. One in nine people 65 and older (11 percent) have Alzheimer's.

- 5.1 million Americans with Alzheimer's are 65 or older.
- Younger-onset Alzheimer's affects an additional 200,000 people.
- About one-third of people who live to be 85 or older develop Alzheimer's.
- The vast majority of those with Alzheimer's are 75 or older—81 percent.
- Almost two-thirds of those with Alzheimer's are women. Earlier thinking was that this difference was because women live longer on average than men, but some studies suggest some increased risk may be directly linked to gender. Biological and genetic factors are cited in some studies, including one

genotype that has a stronger association with Alzheimer’s in women than in men. In other studies, life experiences such as type and amount of education and occupation may play a role.

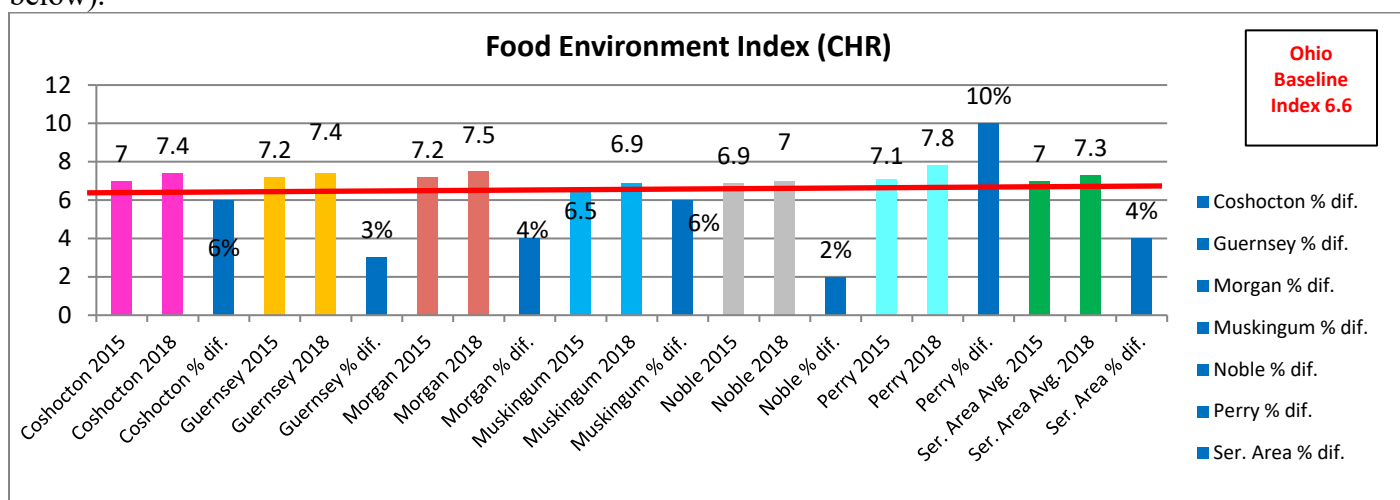

- Older African-Americans are twice as likely to develop Alzheimer’s and older Hispanics are one and one half times as likely to have the disease and other forms of dementia as compared to older whites. Differences in health, lifestyle and socioeconomic risk seem to account for the disparity, not genetic factors related to race and ethnicity.

The 10 states with the smallest projected 10-year increase—between 14.3 and 21.6 percent—are Indiana, Iowa, Kansas, Missouri, Nebraska, New York, North Dakota, Ohio, Pennsylvania and Wisconsin (Alzheimer’s Association 2015). State and local data was not available to fully assess this condition in the GHSA for those living with Alzheimer’s disease.

4.4.2. Risks Associated with the Leading Chronic Conditions

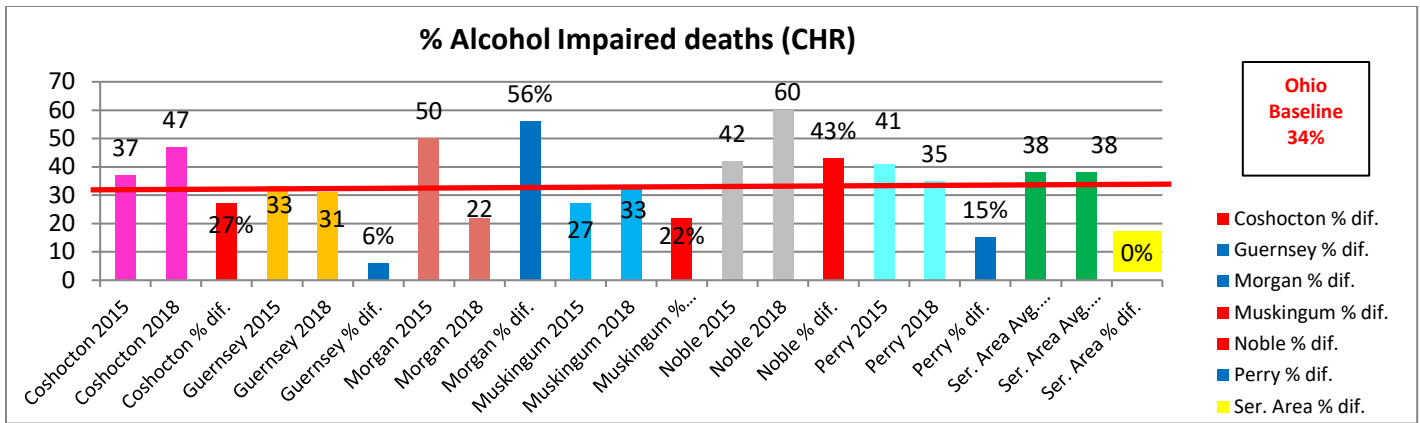

4.4.2.A Access to Healthy Foods

Access to a healthy foods and food environment affects a person’s ability to eat healthy. Unhealthy eating puts people at risk of heart disease, cancer, strokes, Alzheimer’s disease, diabetes and obesity. The CHR used an index of factors that contributed to a healthy food environment 0 (worst) to 10 (best). The Food Environment Index is comprised of two variables: 1) Limited access to healthy foods from the USDA’s Food Environment Atlas which estimates the percentage of the population who are low income and do not live close to a grocery store, and 2) food insecurity for Feeding America estimates the percentage of the population who do not have access to reliable source of food during the past year. According to 2018 CHR, the GHSA had a higher Index rating than Ohio, but many areas still do not have stores or locations to purchase fresh product (See chart below).

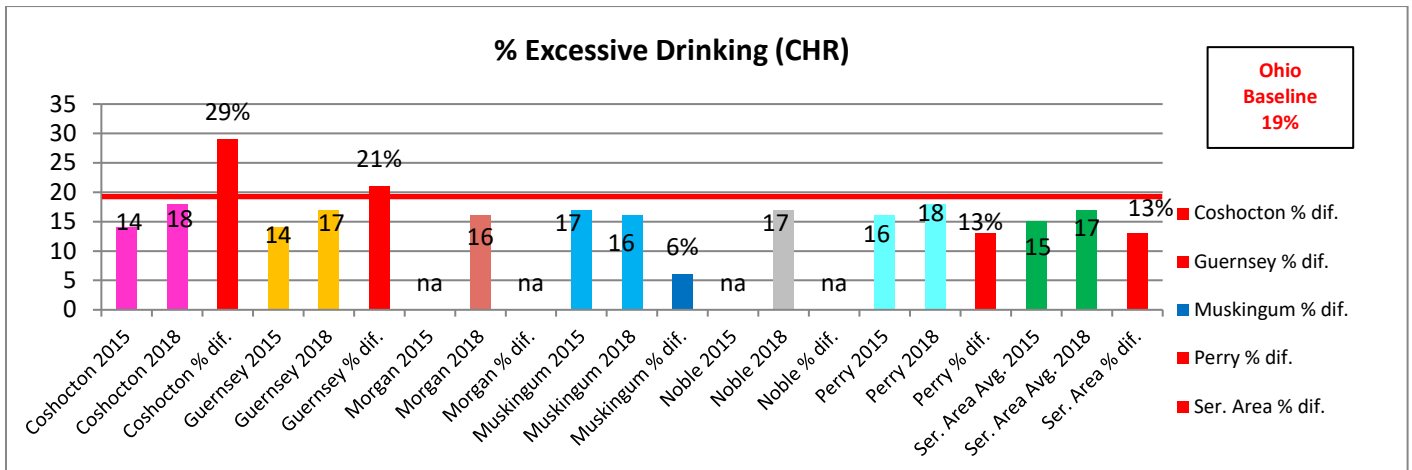

4.4.2.B. Alcohol Overuse

Overuse of alcohol not only causes disruptions of normal brain functions, but also can lead to high blood pressure, cardiomyopathy, coronary heart disease, strokes, cancer, liver problems, a weakened immune system, and Alzheimer’s disease. Alcohol overuse puts people at risk of accidents and injuries. According to 2018 CHR, the GHSA had a higher average percent of alcohol impaired deaths at 38% than Ohio at 34% (See chart on next page).

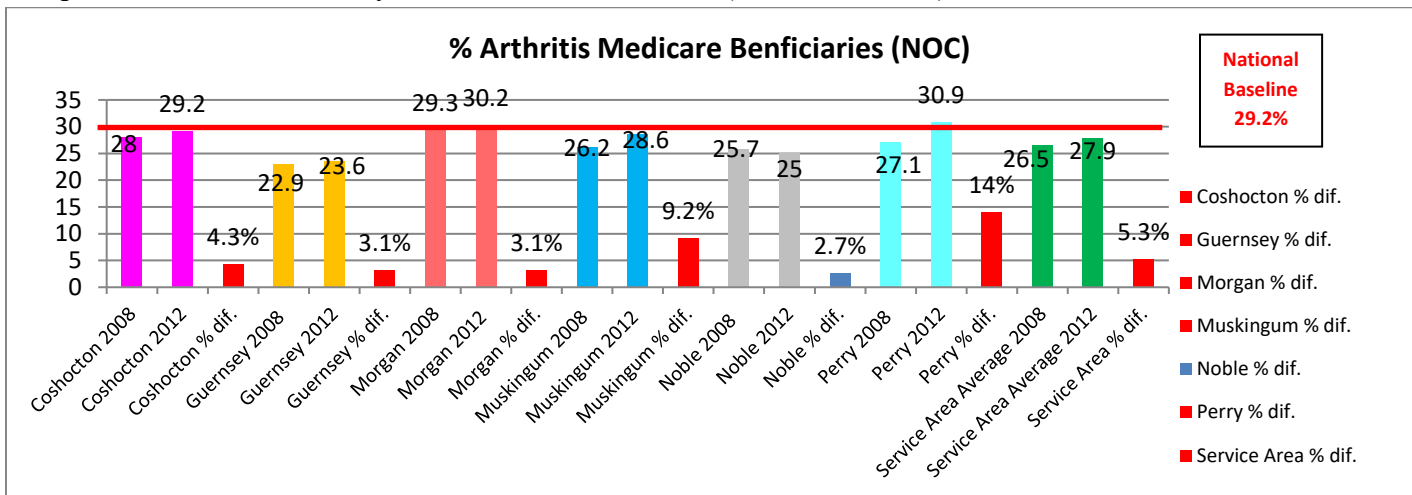

The 2018 CHR reported that for the GHSA, an average of 17% excessively drink compared to 19% for Ohio (See chart below).

4.4.2.C. Arthritis

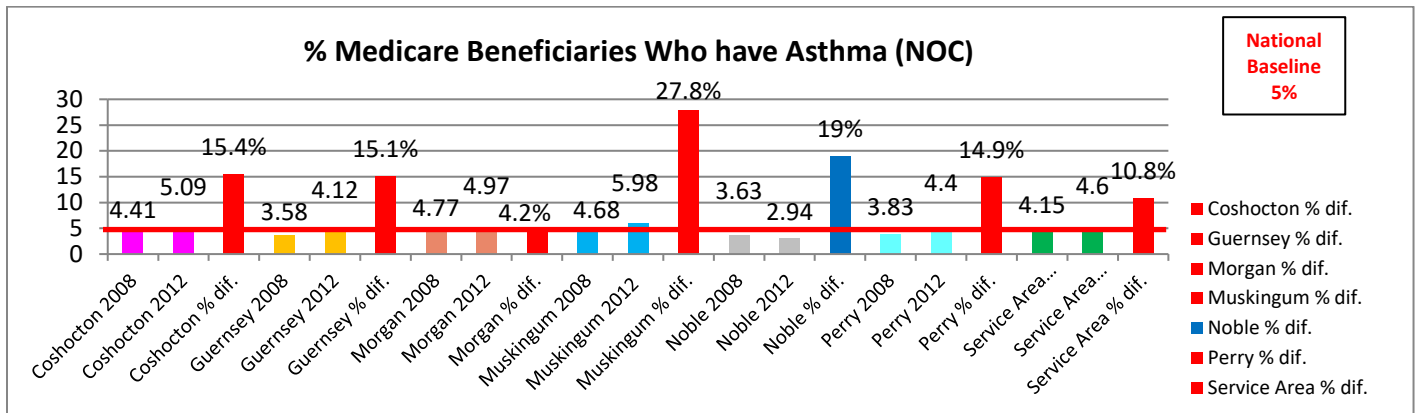

Those with arthritis are at risk for falling and injuries. Those with arthritis are at risk of overuse of pain medications also. For the GHSA there was an average of 27.9% Medicare beneficiaries who had arthritis compared to 29.2% nationally, based on the 2012 NOC (See chart below).

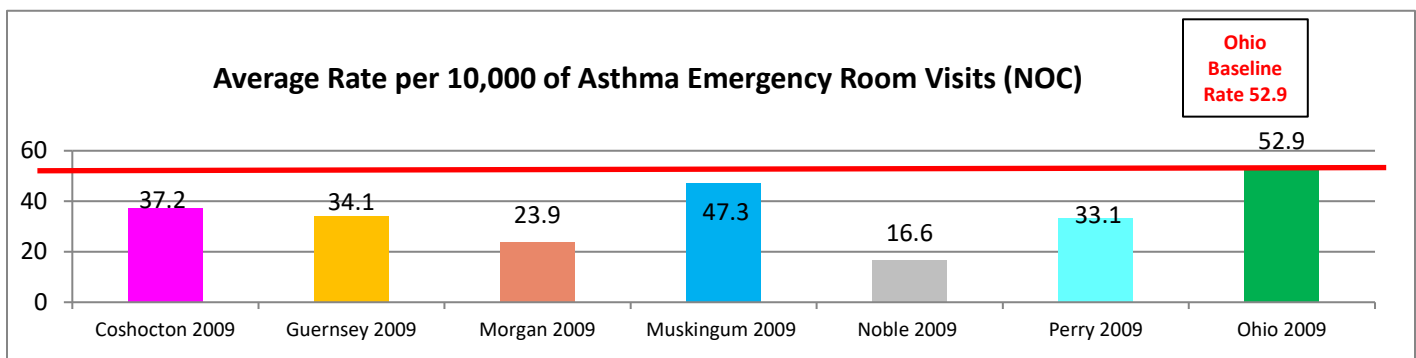

4.4.2.D. Asthma

Asthma puts people at risk for pneumonia and other chronic lung conditions as well as heart disease. Major risk factors for asthma include smoking, second hand smoke and avoidance of irritants that may contribute to

COPD, like chemical fumes, air pollution, and dust. The GHSA has a lower average of 4.6% Medicare beneficiaries with asthma than the national 5%, based on the 2012 NOC (See chart below).

All the counties in the GHSA rate per 10,000 for asthma emergency room visits fall below the Ohio rate, based on the 2009 NOC (See chart below).

4.4.2.E. Black Lung

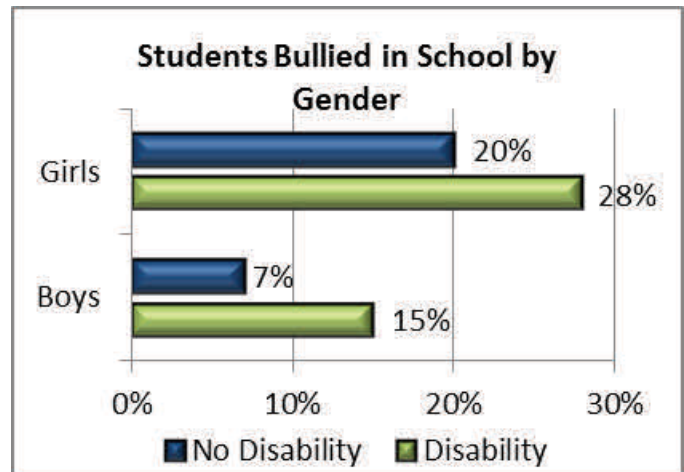

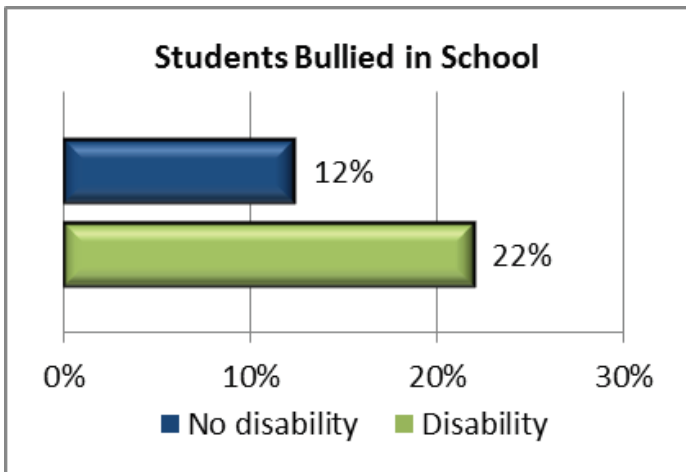

Coal workers' pneumoconiosis, also known as **black lung** disease or **black lung**, is caused by long-term exposure to coal dust. Black Lung puts persons at risk for cancer, chronic lung conditions, and heart disease. It is common in coal miners and others who work with coal. Ohio has a long history of coal miners as a workforce. The US Department of Labor's Division of Coal Miners Workers' Compensation reported in 2017 that Ohio had 56,156 claims filed for Black Lung costing \$9,600,022 in disbursements (See chart below).

Ohio Black Lung Claims	2012	2017
All the filings since July 1, 1973, including terminated, non-approved claims and Medical Benefits Only claims (MBO)s	48,058	56,156
MBOs claims	32	15
Active claims in pay status; excluding MBOs, including Trust Fund, interim and RO pay claims	1,603	1,015
Disbursements of income and medical benefits for all Part C claims including claims paid by the Trust Fund and claims in interim status. Does not include benefits paid by responsible coal mine operators and insurers.	\$13,431,195	\$9,600,022.38

4.4.2. F. Bullying

Bullying can put individuals at risk for mental health issues and accidents/injuries. The 2013 Ohio Youth Risk Behavior Survey examined the relationship between risk populations and a number of health-risk behaviors. The YRBS was an anonymous and voluntary survey among random samples of high school students in 44 public and private high schools collected by ODH in Ohio in 2017. In the charts on the next page, 22% of

students bullied had disabilities and 12% did not for a total of 34% of students bullied. More girls were bullied than boys by almost 15%.

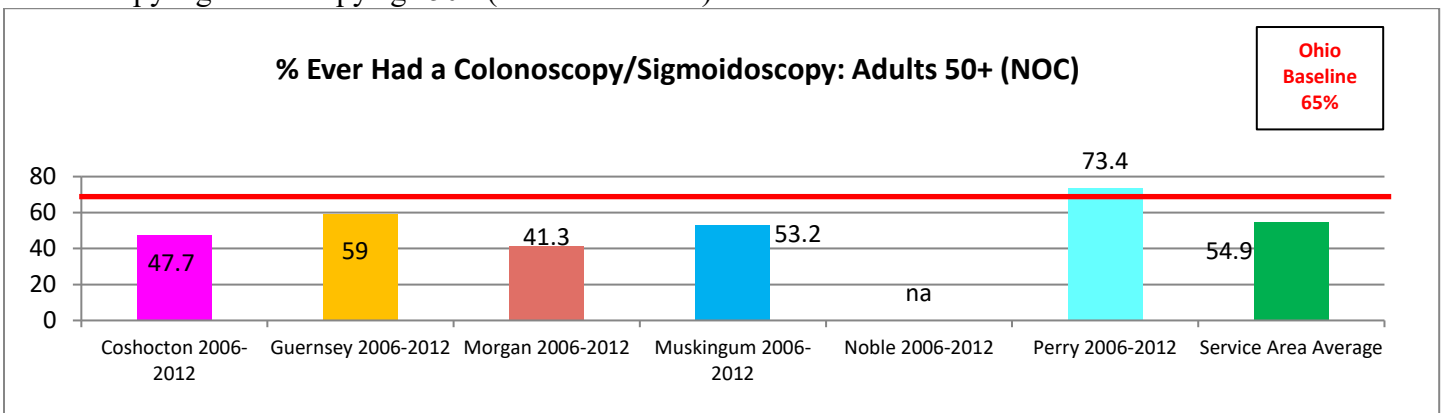

4.4.2. G. Cancer Screening

Cancer screening can help detect cancer at early stages to avoid adverse effects of cancer, lung conditions, and other illnesses related to advanced cancer. People who do not get screened based on the recommended guidelines are at risk of not detecting cancer in its early stages.

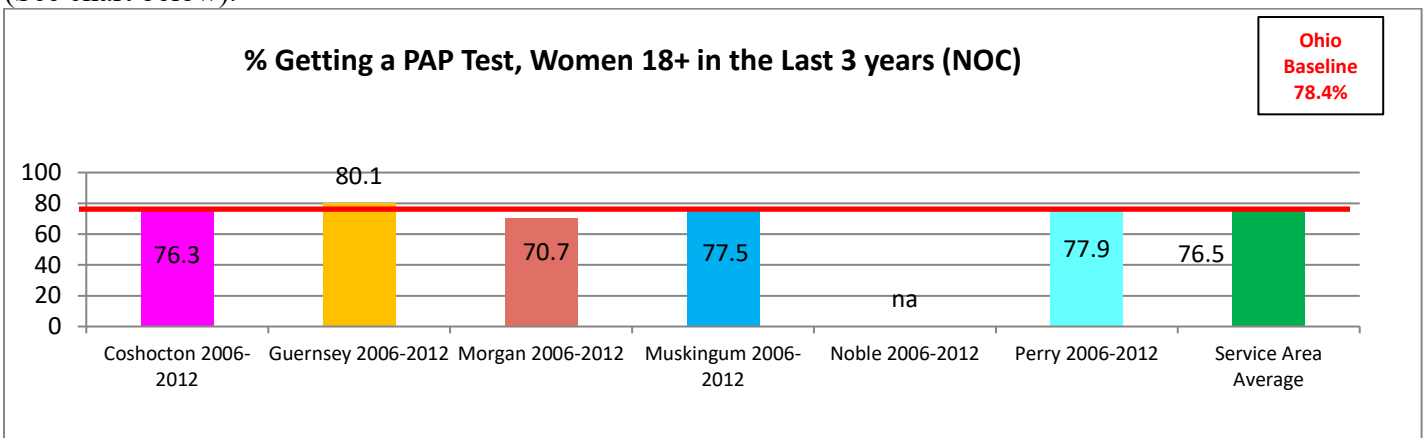

Colonoscopy/Sigmoidoscopy

Based on the 2012 NOC, the GHSA had four out of five counties that were lower than Ohio for ever having a colonoscopy/sigmoidoscopy age 50+ (See chart below).

PAP Test

Only one GHSA county was higher in % of women 18+ getting a Pap test than Ohio, based on the 2012 NOC (See chart below).

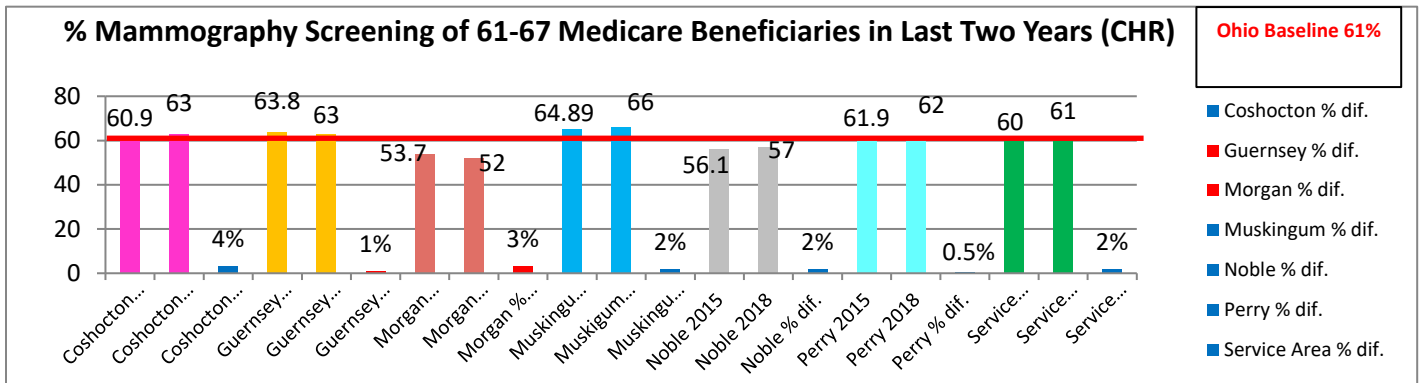

Prostate Exam and Mammography

For 2008-2016, ODH reported for Ohio that the percentage of men aged 40+ who had a prostate exam within the past two years increased from 36.7% to 39% (See chart below). This was low compared to the recommended guidelines.

Prostate Exam Ohio	Yes 2008	Yes 2016	No 2008	No 2016
Percent (%)	36.7	39	63.3	61

According to the 2018 CHR, four out of six counties had a higher percentage of 61% for women screened for mammograms than Ohio (See chart below). The American Cancer Society recommends annual mammograms for women 45-54 and every two years for those 55+.

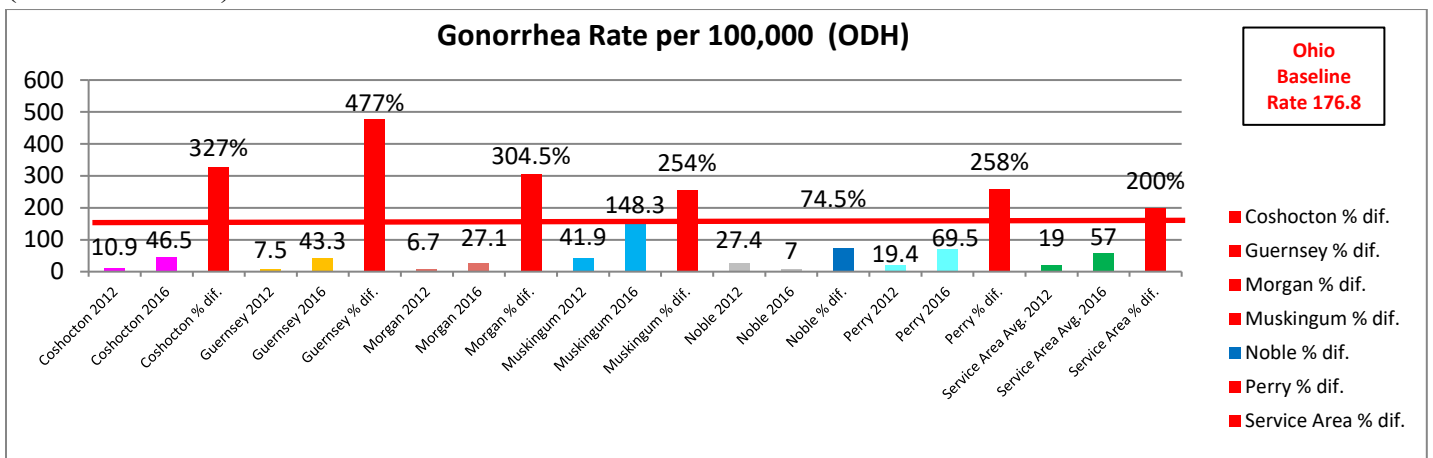

4.4.2. G. Child Neglect/Abuse

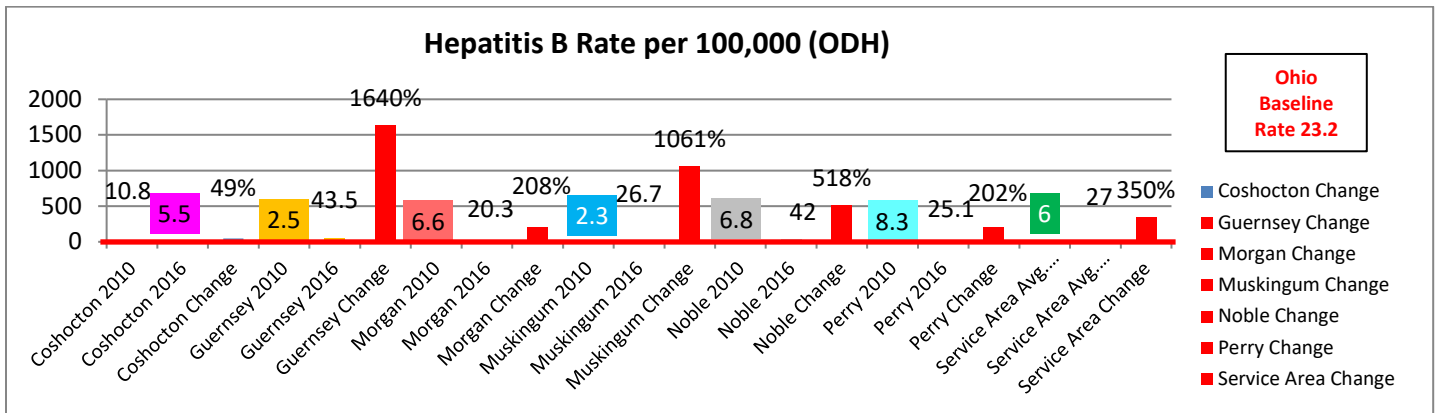

For this issue, see page 6 in the Social Determinants section.

4.4.2.H. Communicable Diseases

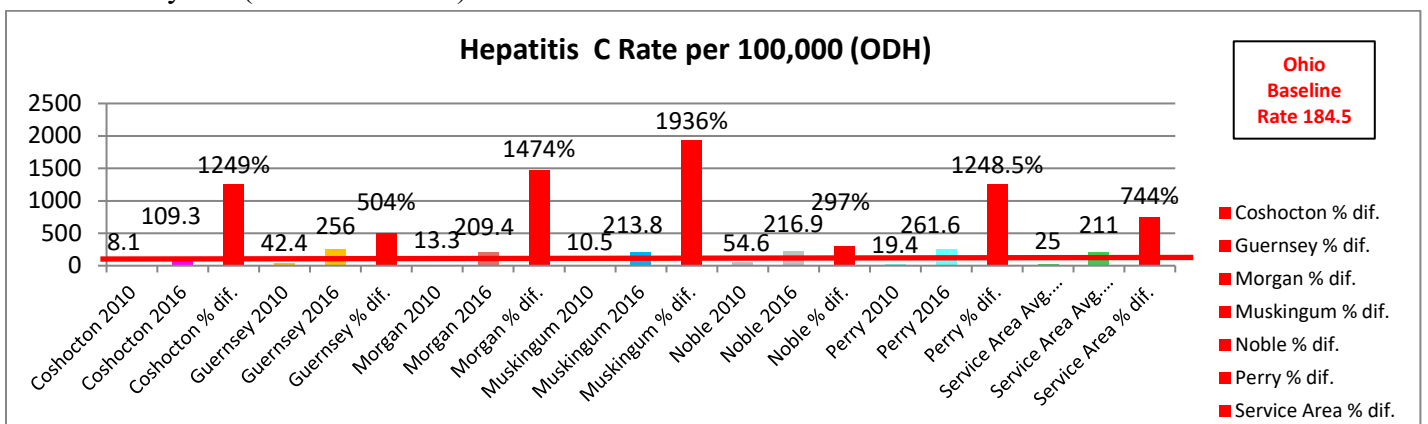

Addictions and some mental health issues can put persons at risk of communicable diseases through participating in unprotected sexual activity, shared needles, and through impaired judgement. For 2016 ODH reported Gonorrhea average rates for the GHSA were lower than Ohio, but increased by 200% in four years (See chart below).

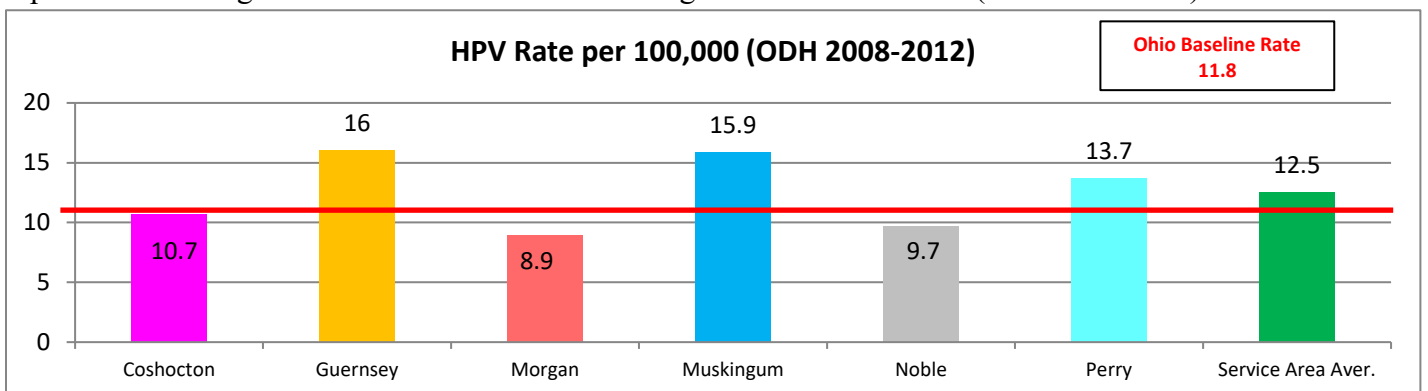

For 2016, ODH reported that Hepatitis B average rates for the GHSA were higher than Ohio and increased by 350% in six years (See chart on next page)

For 2016, ODH reported that Hepatitis C average rates for the GHSA were higher than Ohio and increased by 750% in six years (See chart below).

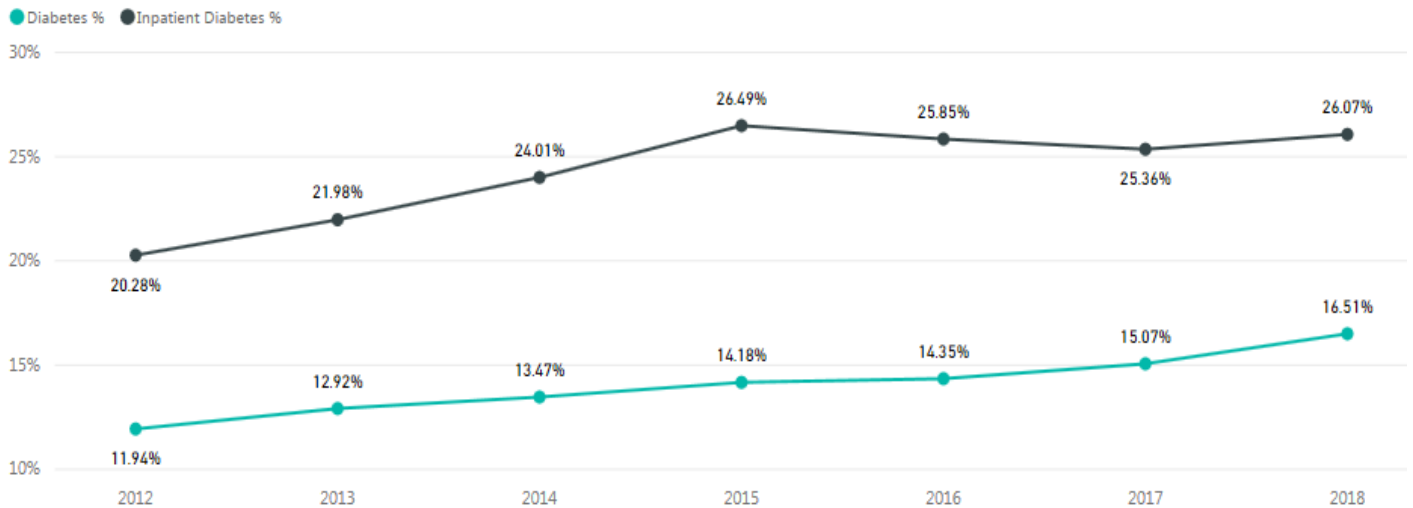

Human Papillomavirus puts persons at risk for cancer of the cervix and other cancers. From 2008-2012, ODH reported the average GHSA HPV rate of 12.5 was higher than Ohio at 11.8 (See chart below).

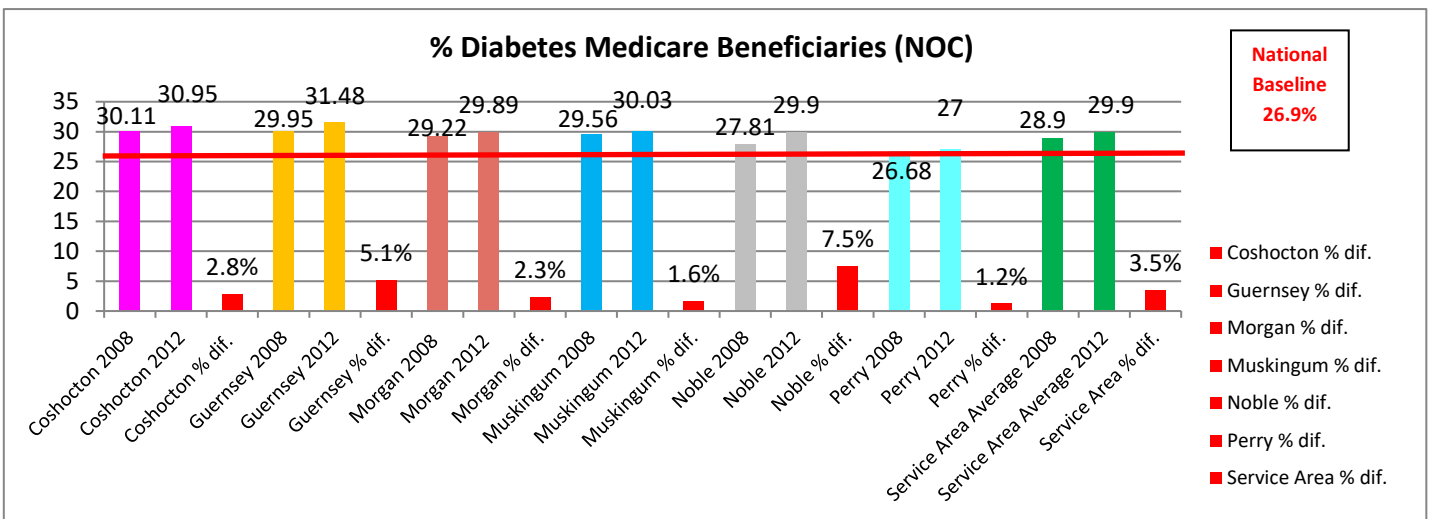

4.4.2.I. Diabetes

Diabetes was the seventh leading cause of death in the community. According to the CDC in 2017, there was an estimated 9.4% diagnosed with diabetes. Diabetes increases a person's risk of cardiovascular disease, heart attacks, cancer, strokes. It was the leading cause of kidney failure, lower limb amputations, and adult onset blindness. Diabetes can put persons at risk for unintentional injuries/accidents if neuropathies, amputations, or blindness affect balance or mobility. For the GHSA, new data was available from the EPIC electronic record system to assess diabetes prevalence for 2016. Based on the GHSA EPIC data, the service area was at much higher risk than the national percentage at 16.51% (See chart on the next page).

Diabetes % and Inpatient Diabetes % by Year

Based on the 2012 NOC, the GHSA had 29.9% Medicare beneficiaries with diabetes, which was higher than the national 26.9% (See chart below).

4.4.2.J. Domestic Violence

People with addictions, mental health issues and Alzheimer’s disease are at risk of impaired judgement which could lead to participating in violent behaviors such as domestic violence. Domestic violence can result in injuries/ accidents. The 2010 Ohio Family Violence Prevention Project revealed the following estimates for those physically abused by their current partner (See chart below).

	Coshocton	Guernsey	Morgan	Muskingum	Noble	Perry
Estimate of Number of Those Physically Abused by Current Partner 2010	280-360	310-410	110-150	660-860	120-150	260-340

4.4.2.K. Elder Neglect/Abuse

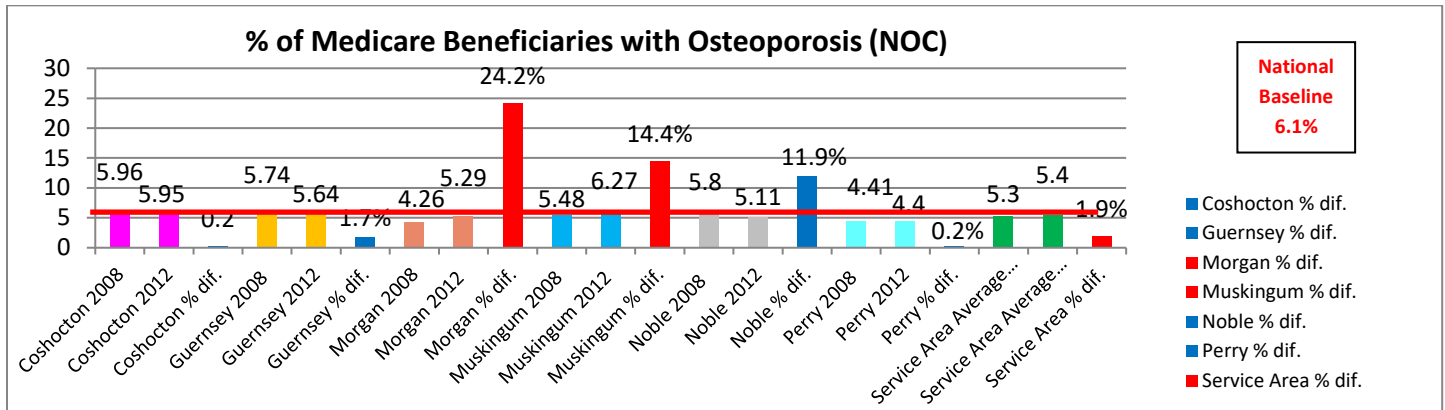

Elderly populations are at risk of many chronic conditions such as addictions/mental health issues, heart disease, cancer, chronic lung conditions, strokes, and Alzheimer’s disease. Elderly persons dependent upon others for care can be at risk for neglect/abuse also. Many chronic conditions require medications and medical

care and care takers can withhold these services from the elderly. Care takers can financially exploit the elderly. There is also a risk of injuries/accidents for the elderly who suffer neglect/abuse due to violence. The 2010 Ohio Family Violence Prevention Project revealed the following estimates for seniors in the community abused, neglected, or financially exploited and seniors in long term care facilities abused, neglected, or financially exploited (See chart below).

2010	Coshocton	Guernsey	Morgan	Muskingum	Noble	Perry
Estimate of Seniors in the Community Abused, Neglected or Financially Exploited	330-430	360-460	150-190	740-950	110-150	260-330
Seniors in Long Term Care Facilities are Abused, Neglected or Financially Exploited	20-30	30-50	10-20	60-120	na	10-30

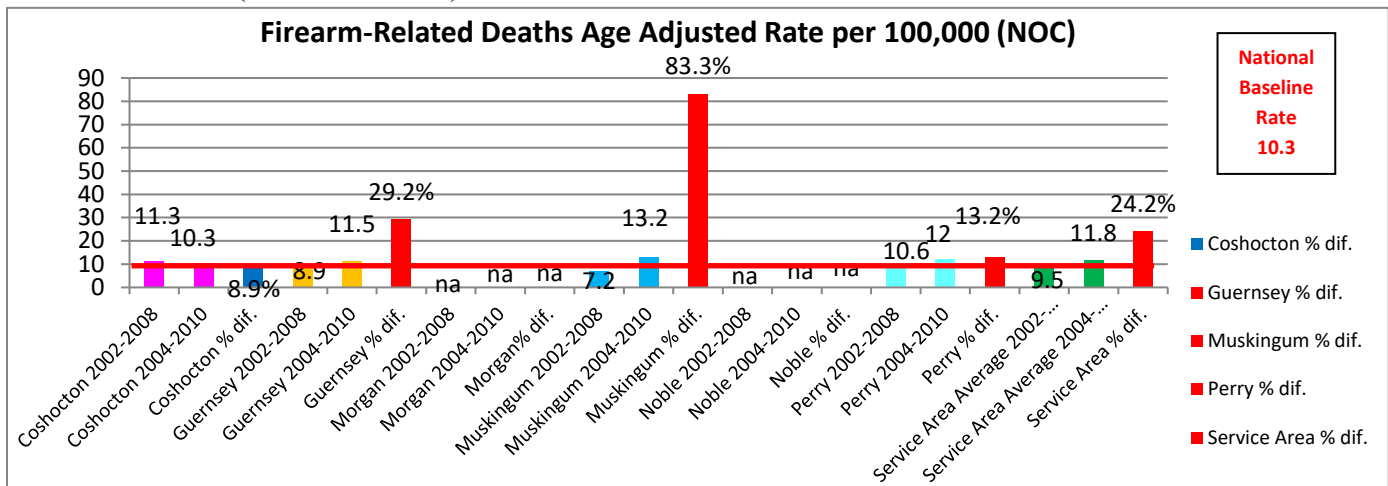

4.4.2.L. Falls

Use of substances, heart attacks, cancer, chronic lung conditions, strokes, and Alzheimer’s disease can all increase risk of falling due to loss of balance, mobility, or sudden illness. Falls are the leading cause of non-fatal injury for both hospitalizations and ED visits. Those with arthritis are at risk for falls due to injured/painful joints and degeneration of joints (See Arthritis page 21). Falls can be caused by sudden breaks in bones due to Osteoporosis. Based on the 2012 NOC, an average of 5.4% of Medicare beneficiaries in the GHSA had osteoporosis which was lower than the national baseline of 6.1% (See chart below).

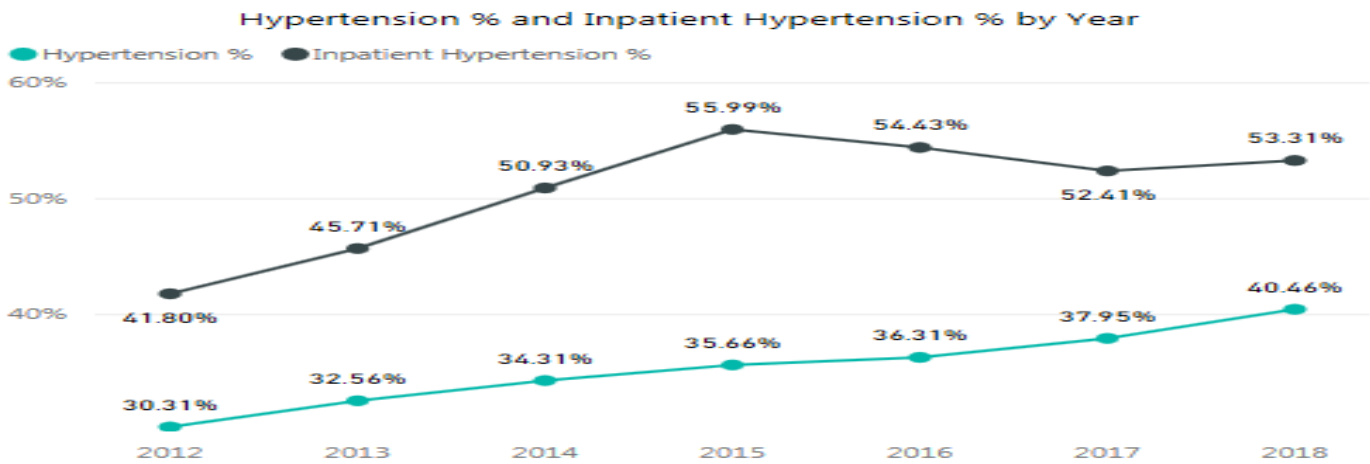

4.4.2.M. Firearms

Those with addictions/mental health issues who own firearms can put themselves at risk of injuries/accidents to themselves and others and potentially cause a death from use of firearms, if judgement is impaired. Based on the 2004-2010 NOC, the GHSA had an average rate of 11.8 for firearm-related deaths which was higher than the 10.3 for Ohio (See chart below).

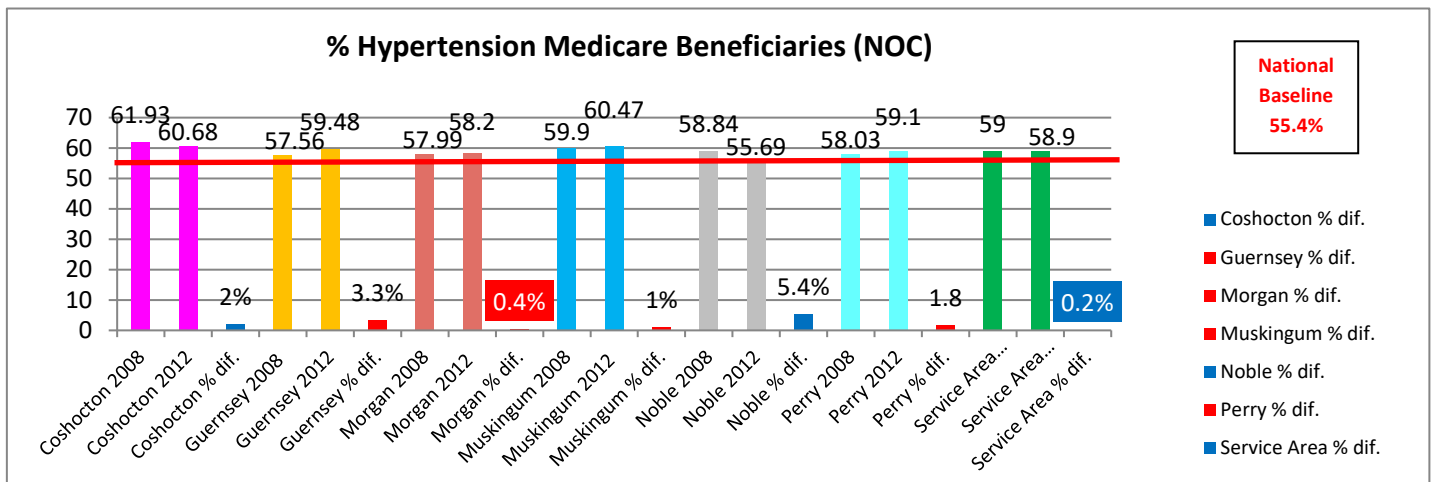

4.4.2.N. High Blood Pressure

High blood pressure is a risk factor for heart disease and strokes. Data obtained through the 2018 GENESIS EPIC system revealed 53.3% inpatient and 40.5% in the GENESIS population were hypertensive in 2018 (See chart below). Obesity, high cholesterol, smoking, physical inactivity, and diabetes all can affect high blood pressure.

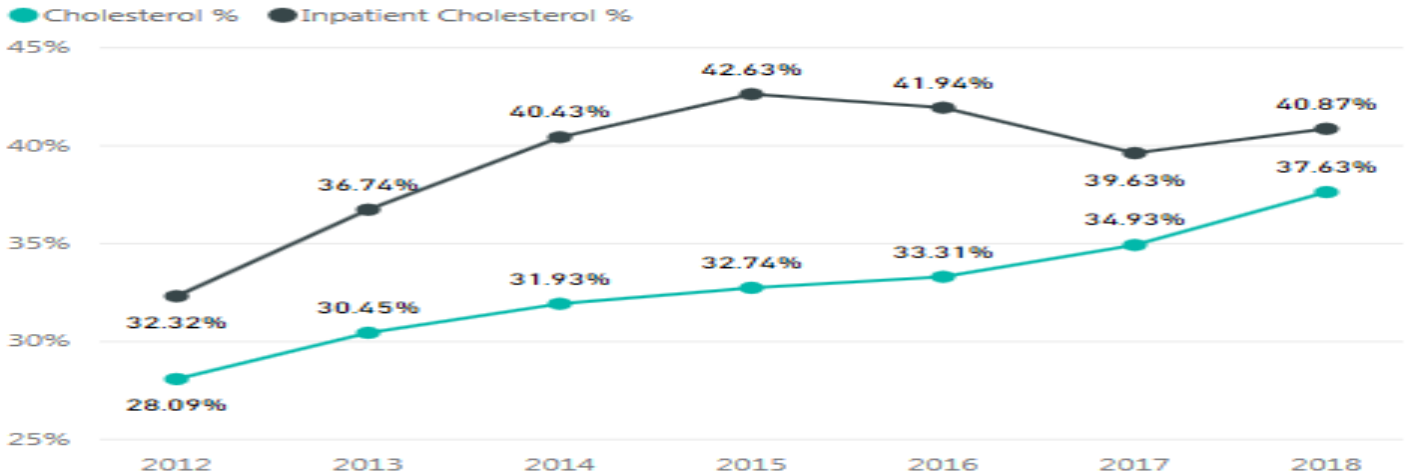

Based on the 2012 NOC, the GHSA had an average of 58.9% Medicare beneficiaries with hypertension which was higher than Ohio at 55.4% (See chart below).

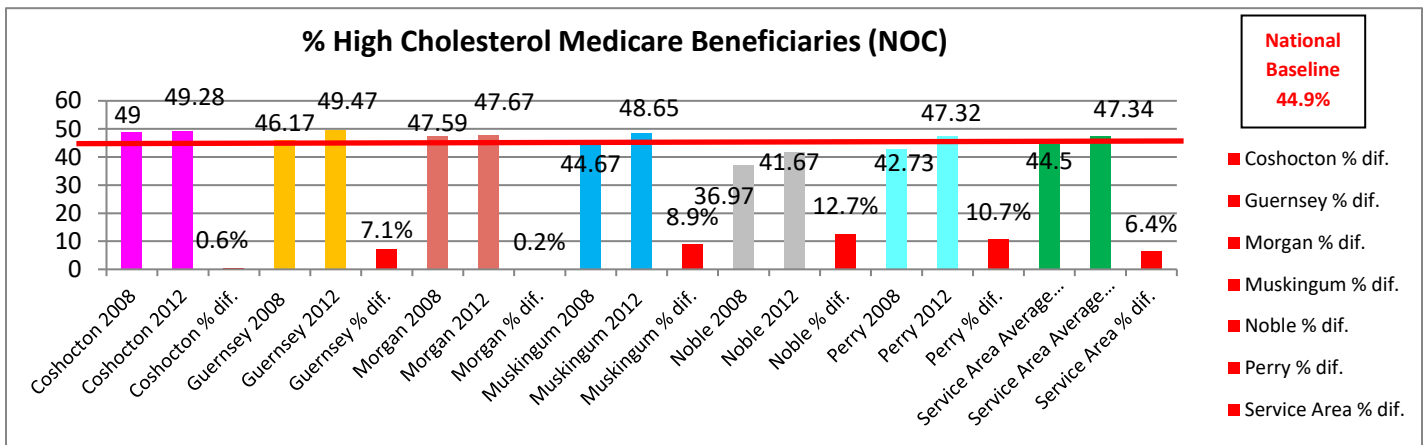

4.4.2.O. High Cholesterol

Unhealthy eating habits are a combination of too much fat in the diet and not enough healthy fats in the diet, overconsumption of foods with empty calories such as sugar, and diets low in fiber. High cholesterol affects GHSA community members' risk for addictions/mental health issues, heart disease, cancer, strokes and Alzheimer's disease. According to the CDC nearly 36% of Americans have high cholesterol. For the GHSA, new data are available from the EPIC electronic record system to assess cholesterol risk of those in the system for 2016. Based on the GHSA EPIC data, the service area was at higher risk at 37.63% than the national percentage at 36% (See chart on the next page).

Cholesterol % and Inpatient Cholesterol % by Year

Based on the 2012 NOC, the Medicare beneficiaries in the GHSA had an average higher cholesterol percentage at 47.3% than the national percentage at 44.9% (See chart below).

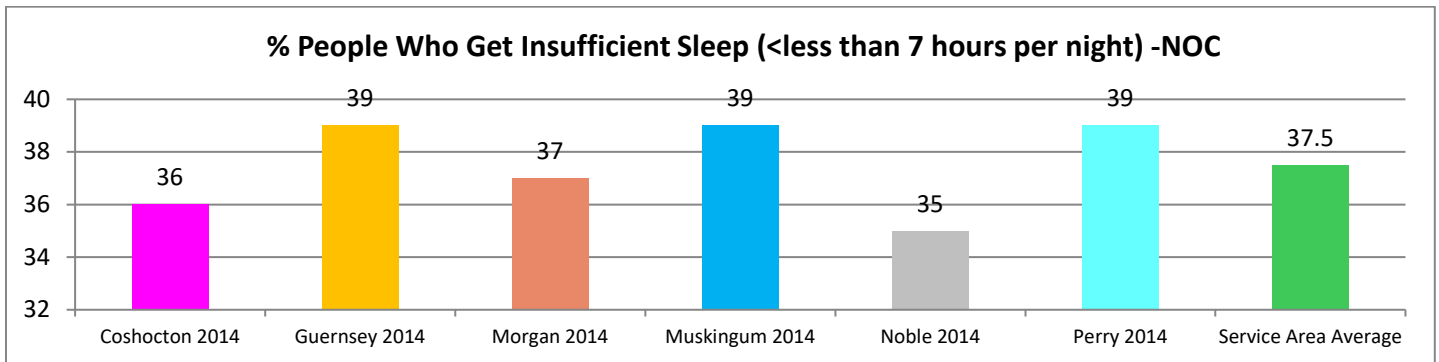

4.4.2.P. Joint & Back Pain

Joint and back pain can be caused by cancer and unintentional injuries/accidents and can put individuals at risk of addictions/mental health issues due to over medicating for pain or uncontrolled pain. Joint pain can be caused by many conditions such as falls (See Falls page 26), arthritis (See Arthritis page 21), and unusual exertion or overuse, including sprains or strains (See Workplace Injuries pages 35-36).

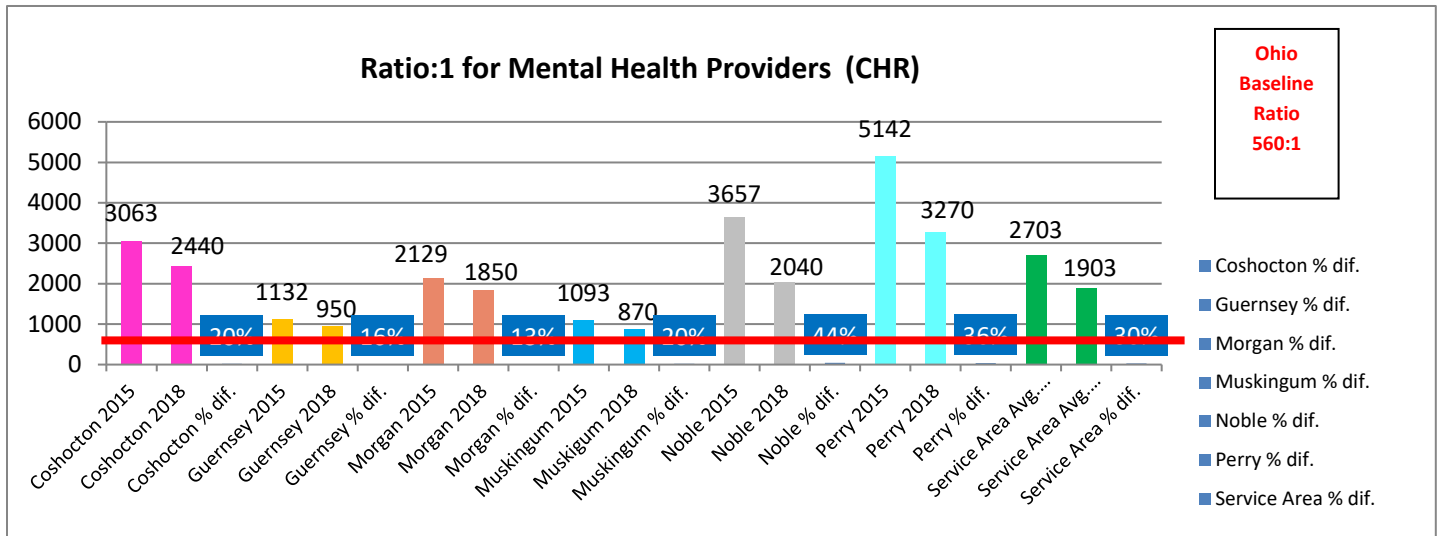

4.4.2.Q. Lack of Sleep

Lack of sleep is a risk associated with heart disease (heart attacks) and strokes. Addictions/mental health issues and Alzheimer’s disease can cause lack of sleep. Based on the 2014 NOC, there was a GHSA average of 38% of people who get insufficient sleep (See chart below).

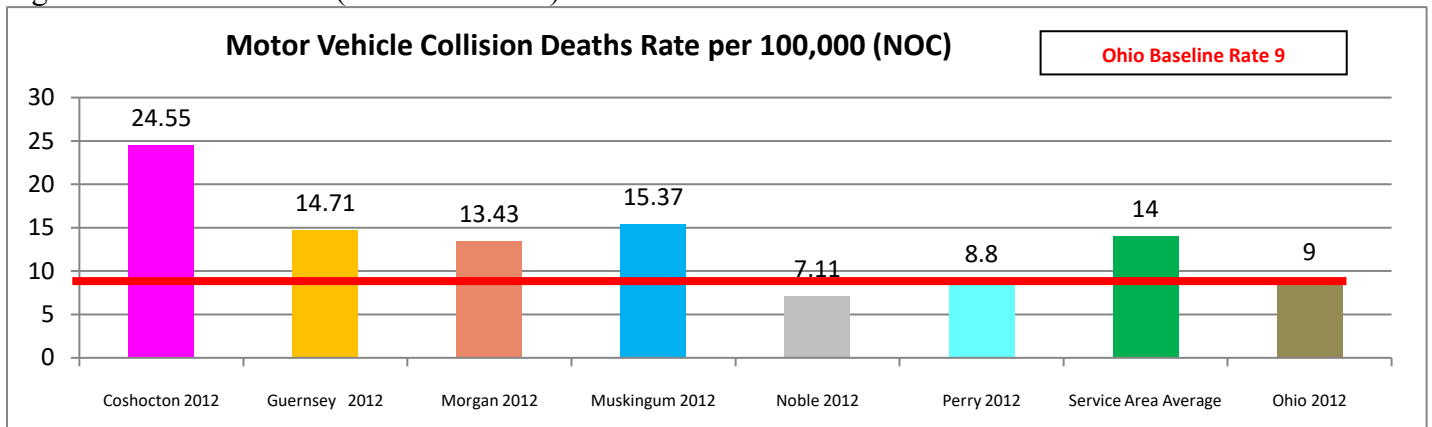

4.4.2.R. Mental Health Provider Ratio

Access to mental health providers continues to be a challenge for the community. The 2018 CHR reported that the ratio of mental health providers to residents for all counties was substantially higher for the GHSA than Ohio (See chart below). The need for more mental health providers for the GHSA is urgent. All six counties in the community are designated by the Health Resources and Services Administration (HRSA) as Mental Health Shortage Areas.

4.4.2.S. Motor Vehicle Accidents

Some of the risk for motor vehicle accidents is higher for those with addictions/mental health issues impaired judgement, heart disease (heart attacks), strokes, and Alzheimer's disease. Based on the 2012 NOC, the GHSA average rate of motor vehicle collision deaths (14) was higher than Ohio (9). Four out of six counties were higher than the Ohio rate (See chart below).

4.4.2.T. Need Detox

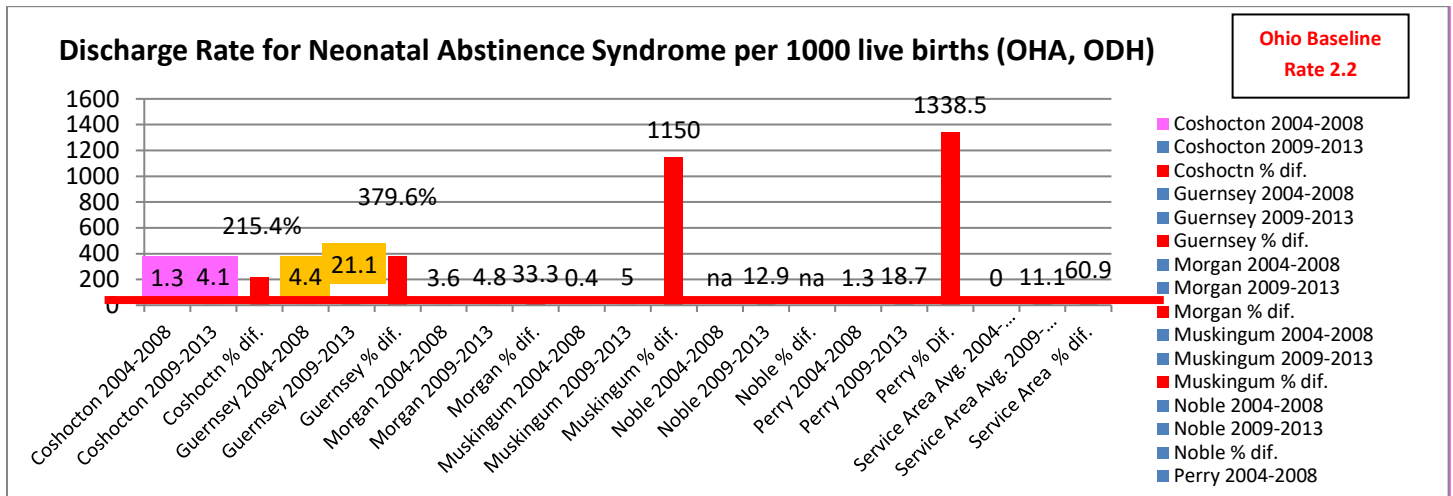

As stated in Priority Chronic Condition Addictions/Mental Health Issues, Genesis Hospital Emergency Services has seen over 60 overdoses a month since January for over 600 overdoses to date. There are services available in the GHSA for detox (Appendix 5.3 page 56) but not enough to be able to serve this many individuals, especially if 100% sought treatment. This is still a huge area of need.

4.4.2.U. Neonatal Abstinence Syndrome Babies

According to the March of Dimes in 2016, 1 in 20 mothers took street drugs during pregnancy (5%). Using street drugs can cause problems before and during pregnancy including inability to get pregnant, problems with the placenta, preterm labor, miscarriage and stillbirth. Babies born to moms who use street drugs during

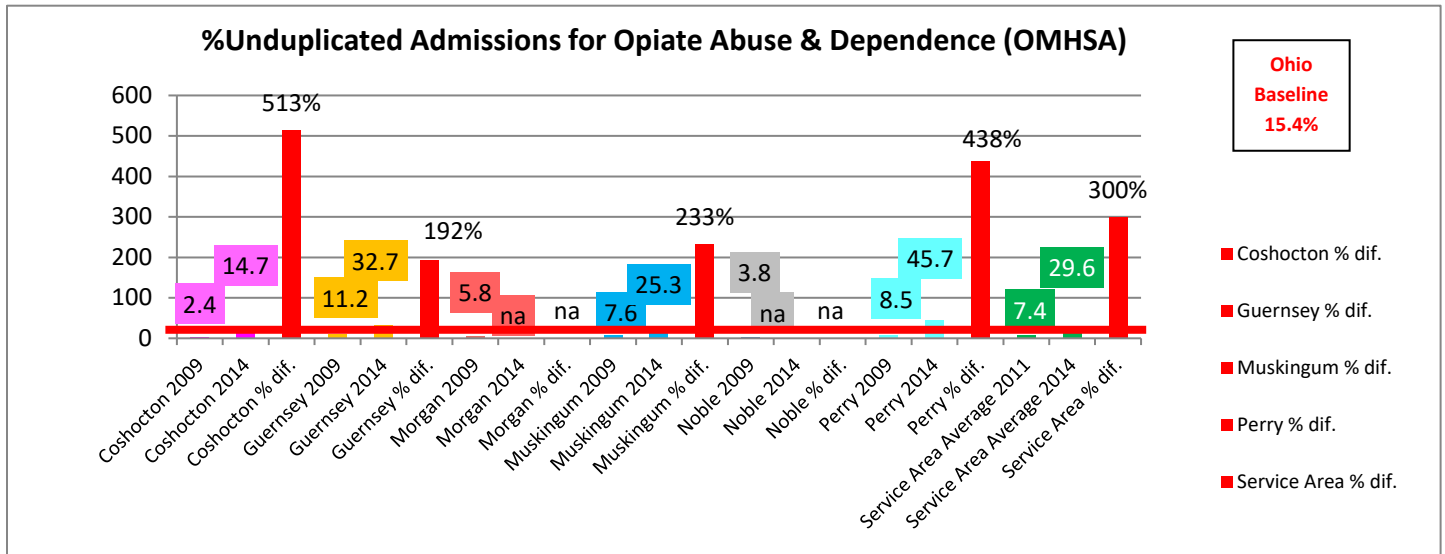

pregnancy often have these complications: premature birth, low birthweight, smaller-than-normal head size, heart defects, birth defects, infections, and Neonatal Abstinence Syndrome (also called NAS). Babies born to moms who use drugs often have problems later in life, including learning and behavior problems, slower-than-normal growth, and Sudden Infant Death Syndrome . Local data is needed to measure the burden of this issue.

The number of babies born addicted to drugs with NAS has risen at alarming rates from 2004-2013 in the community. Each year the GHSA rate per 1,000 births of babies with NAS was rising at a faster rate than Ohio. From 2009-2013, the Ohio Hospital Association and ODH reported that the discharge rate of babies born addicted for the GHSA increased by 84% compared to the Ohio rate rising by 75% (See chart below).

4.4.2.V. Opioid Use

Those at risk for opioid use are those with addictions/mental health issues, heart disease, cancer, chronic lung conditions, strokes, injuries/accidents, and Alzheimer’s disease due to chronic pain, mental suffering, and overuse of pain medications. OMHSA reported from 2009-2014 that the unduplicated admissions for opiate-related diagnoses for treatment quadrupled for the GHSA while Ohio’s percentage doubled (See chart below). This is an urgent health issue for the GHSA (See Priority Chronic Condition Addictions/Mental Health Issues pages 12-14).

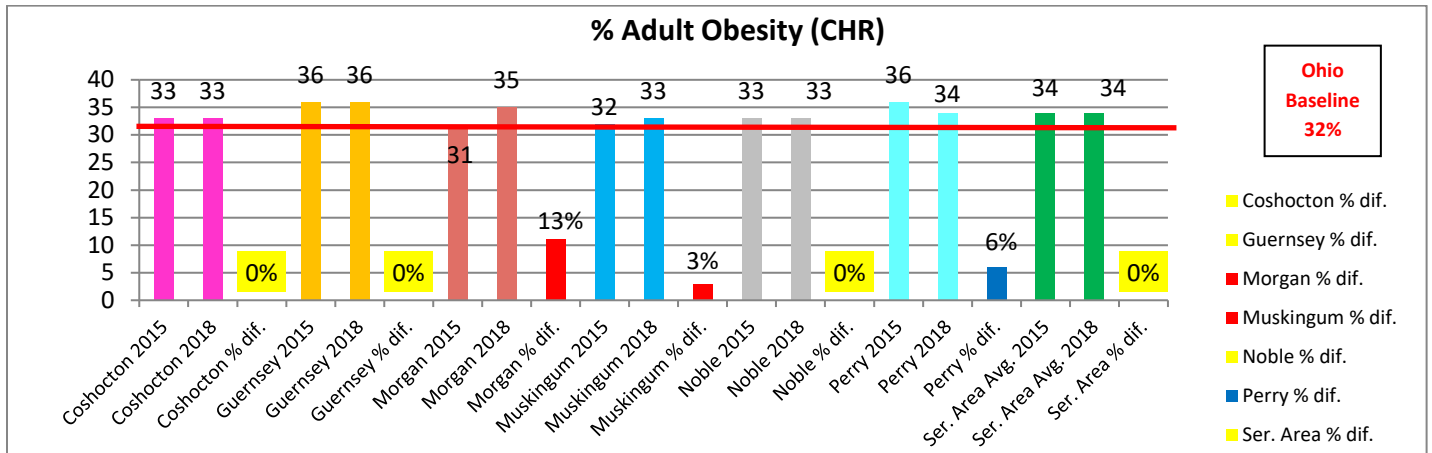

4.4.2.W. Overweight/Obese

Obesity Risk

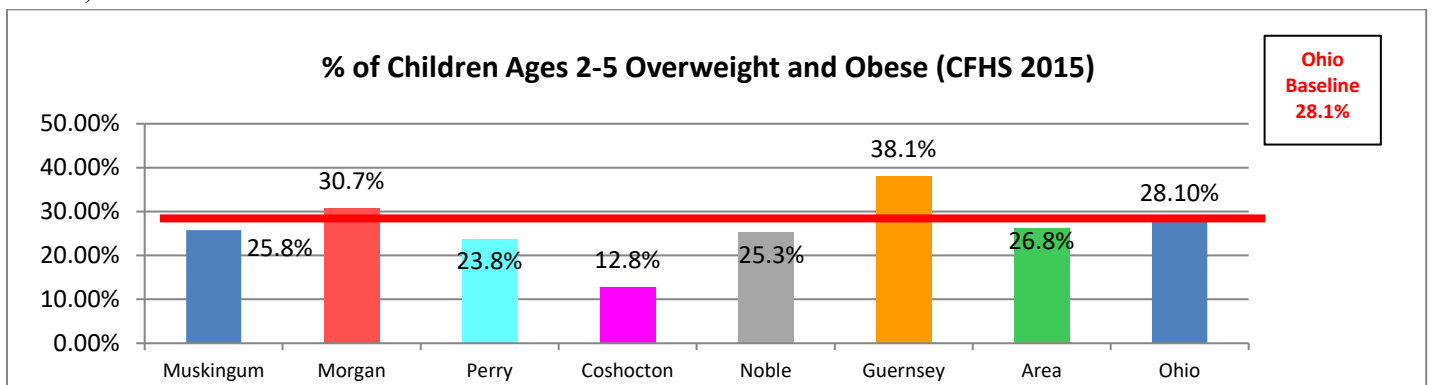

Adults

Body Mass Index (BMI) is a number calculated from a person's weight and height. BMI is used to consider persons obese if the BMI is over 30. BMI does not measure body fat directly, but research has shown that BMI correlates to direct measures of body fat. Individuals who have a BMI of 30 are at an increased risk for: addictions/mental health issues, hypertension, high cholesterol, type 2 diabetes, heart disease, chronic lung conditions, stroke, gallbladder disease, osteoarthritis, sleep apnea, endometrial problems, and breast, and colon cancers. CHR reported in 2018 that the GHSA average was higher for reported BMI at 34% than Ohio at 32% (See chart below).

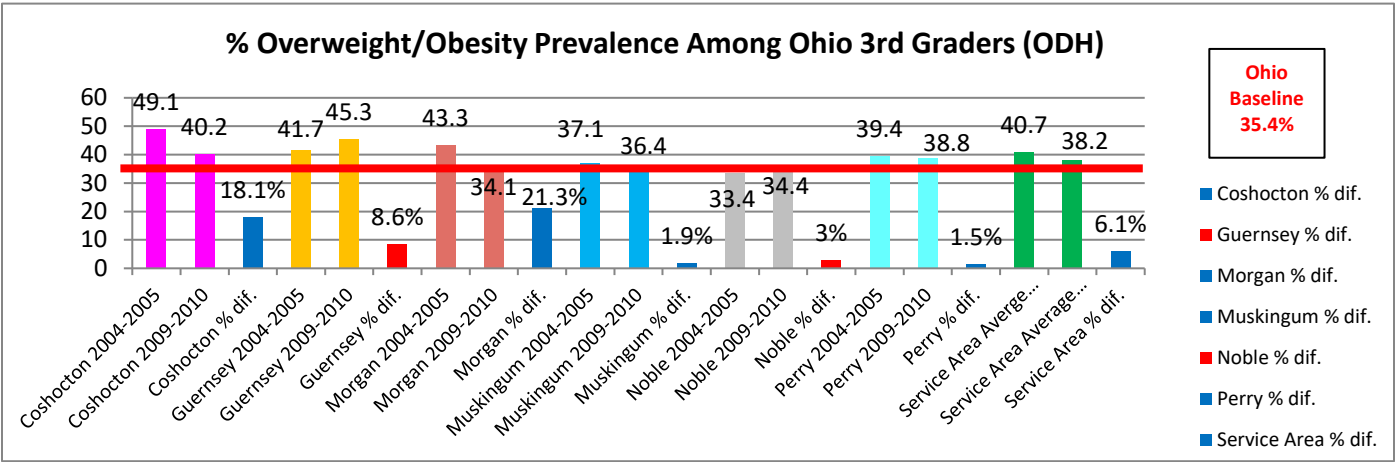

Children

Children are at particular risk of adult illnesses due to childhood obesity. In the GHSA, children overweight and obese, is an urgent health issue. Nationally the rates for children and obesity have sky-rocketed. For children ages two through five in the GHSA, the average percentage of the children overweight and obese was at 26.08% which was slightly less than Ohio at 28.1% according to 2015 Child and Family Health Services (CFHS). Morgan and Guernsey counties children were at higher risk than the other four counties (See chart below).

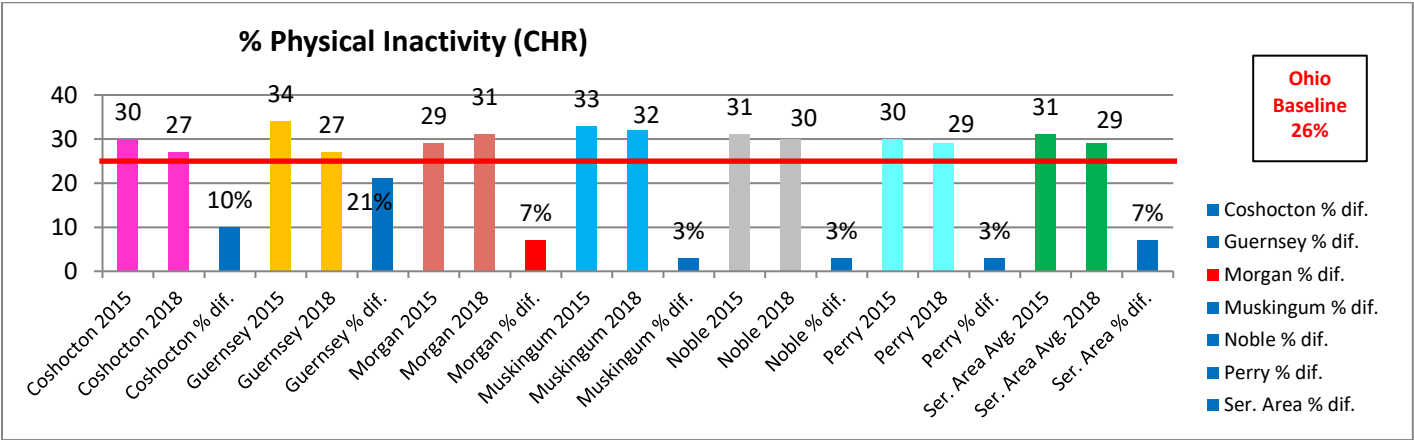

ODH reported from 2009-2010, for third graders in the GHSA, 38.2% were overweight or obese in a BMI study compared to 35.4% for Ohio. Four out of six counties had a higher percentage than Ohio. At least one in three third graders in the GHSA was at risk for obesity (See chart on next page).

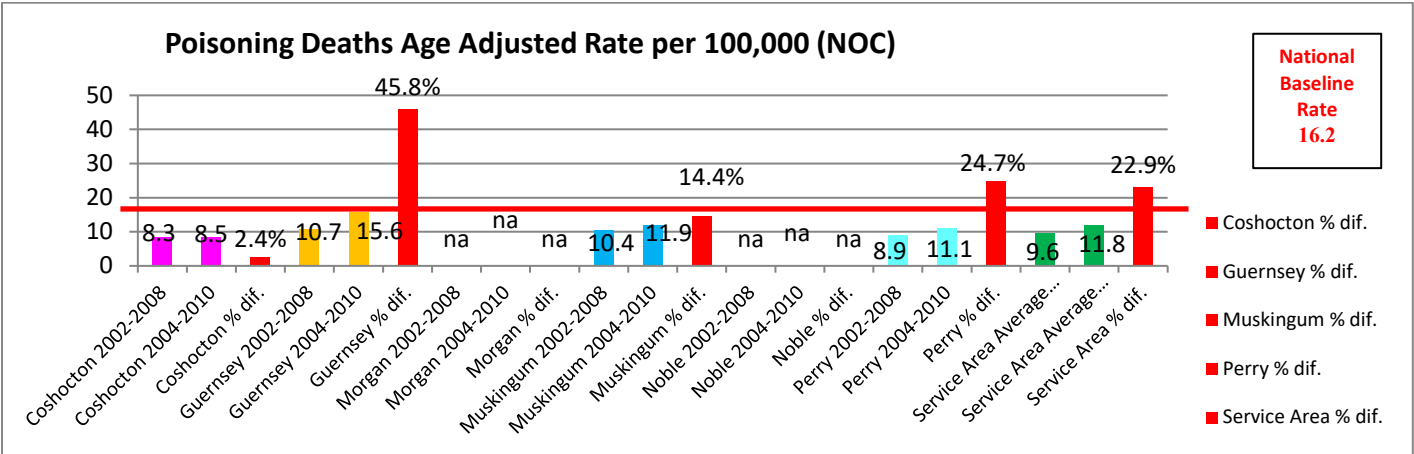

4.4.2.X. Physical Inactivity

Physical inactivity is described as exercising less than three days a week for at least 30 minutes per day doing some activity that raises your heart rate. Those at risk from physically inactivity are those with addictions/mental health issues, heart disease, cancer, strokes, injuries/accidents, Alzheimer’s disease, high cholesterol, diabetes, and obesity. Based on the 2018 CHR reporting, every county in the GHSA had a higher percentage of those physically inactive than the Ohio percentage (See chart below).

4.4.2.Y. Poisoning

Poisoning is a risk for those suffering addictions/mental health issues and is a cause of unintentional injuries/accidents and deaths. Based on the 2004-2010 NOC, the GHSA average rate (11.8) was lower than Ohio (16.2) for poisoning deaths (See chart below).

4.4.2.Z. Residential Housing for Addictions

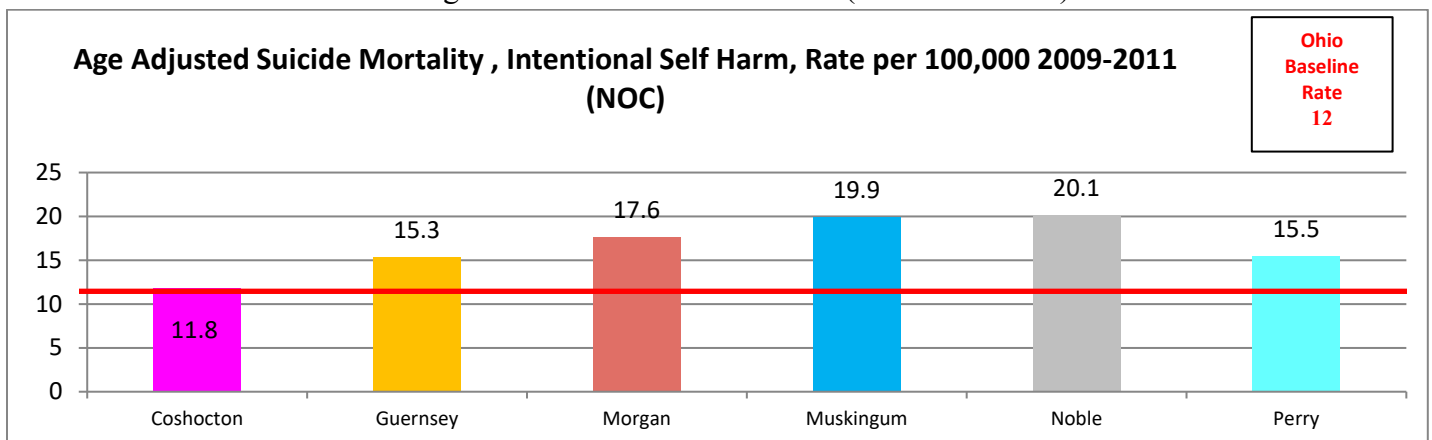

As stated earlier, Genesis Hospital Emergency Services has seen over 60 overdoses a month since January for over 600 over doses to date. There are services available in the GHSA for residential housing for addictions (Appendix 5.3 page 57), but not enough to be able to serve this many individuals, especially if 100% sought treatment. This is still a huge area of need.

4.4.2.AA. Sexual Assault

According to the Ohio Office of Criminal Justice there were the following number of rapes in GHSA counties in 2016: 11 Coshocton, 7 Morgan, 47 Muskingum, and 15 for Perry. For Ohio, 33% of rapes are ages 12-17 and 83% are female. 93% of the suspects are male and the average age is 31.4 years. (Also see Domestic Violence page 25)

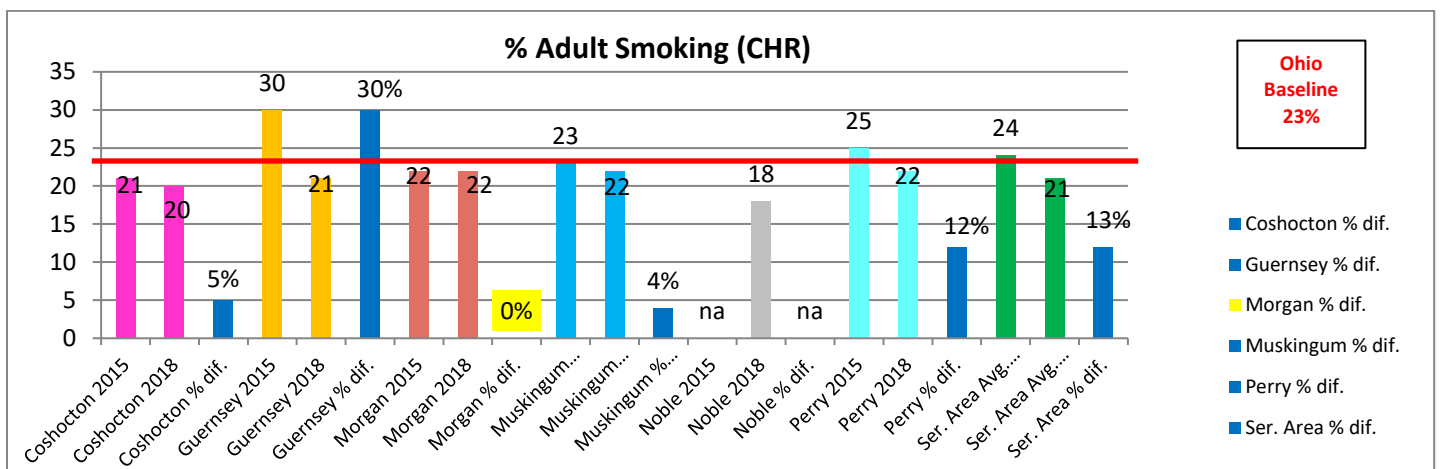

4.4.2.BB. Suicide

Those with addictions/mental health issues, heart disease, cancer, chronic lung conditions, unintentional injuries/accidents and Alzheimer’s disease are at risk of suicide. According to the 2009-2011 NOC, five of the six counties in the GHSA had a higher rate of suicides than Ohio (See chart below).

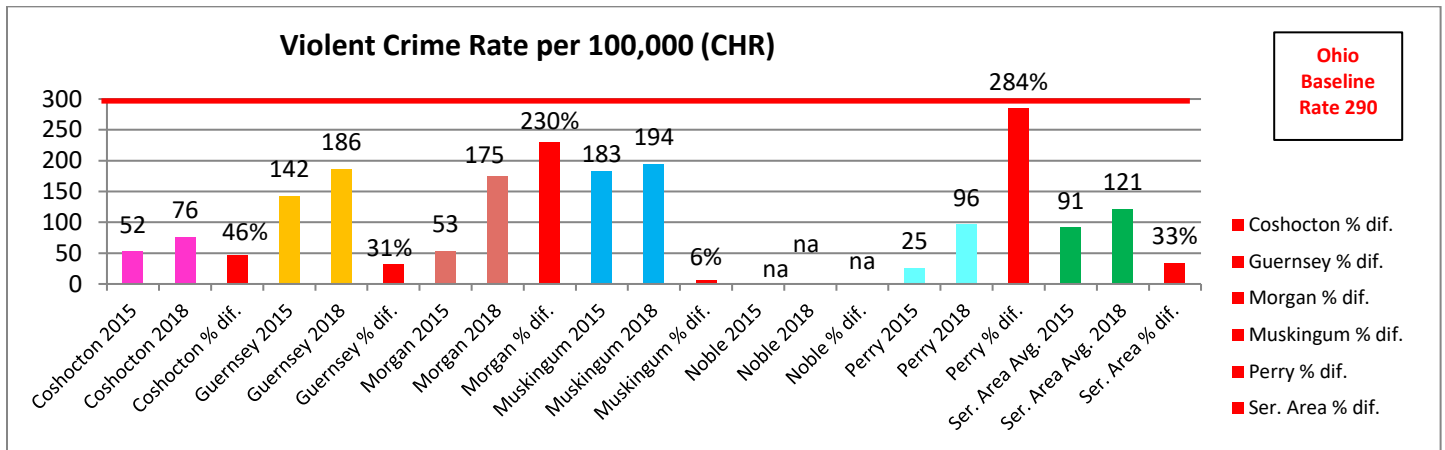

4.4.2.CC. Tobacco Use

Most health organizations publish that tobacco use is the single most preventable risk factor for death and disease, especially cancer and heart disease. Tobacco use also puts those at who suffer from addictions/mental health issues, chronic lung conditions, strokes and Alzheimer’s disease. For 2018, CHR reported there was an average of 21% in the GHSA of smoking adults, which was below the Ohio average of 23% (See chart below). Even though over the last five years cigarette smoking has decreased in the GHSA, still one in five persons smoke.

4.4.2. DD. Violence

Those with addictions/mental health issues and Alzheimer’s disease are at risk for violence behaviors and injuries and accidents to themselves and others. For 2018, CHR reported that the GHSAs violent crime rate was an average of 121 which was lower than Ohio at 290 (See chart below).

4.4.2.EE. Work Related Injuries

Those with addictions/mental health issues, cancer, chronic lung conditions, and Alzheimer’s disease are more at risk for work related injuries due to impaired judgement, loss of balance, decreased mobility and weakness of muscles and joints. According to the 2013 Ohio Survey of Occupational Injuries and Illnesses Data, the most common type of work injury in Ohio was sprains, strains, and tears at 41.6% in the private industry and 54.5% in the public sector industry. Backs are the most common body part injured in both the private industry (17.8%) and the public sector industry (14.5%). Back injuries are the major cause of back pain. Occupational back injuries are the top cause of injuries at work, especially in the health care industry from movement of patients. 15.8% injured their back, more than any other body part. The nature of those injuries was 39.2% for sprains/strains and tears. Local data is needed to measure the burden of this issue-see charts below and on the next page.

Ohio Private Industry		
<p>Private industry sectors with the highest total recordable cases incident rates per 100 FTE workers in Ohio were:</p> <ul style="list-style-type: none"> Healthcare & social assistance 4.0 Agriculture, forestry, fishing & hunting 3.8 Manufacturing 3.5 Transportation & warehousing 3.4 Construction 3.2 Wholesale 2.9 	<p>Occupation groups with highest incidence rates for days away from work (DAFW) cases per 10,000 full time workers:</p> <ul style="list-style-type: none"> Transportation & material moving occupations 200.1 Building and grounds cleaning and maintenance occupations 156.6 Installation, maintenance, and repair occupations 155.4 Healthcare support occupation 147.7 	<p>Distribution of DAFW cases by type of injury:</p> <ul style="list-style-type: none"> Sprains, strains, tears 41.6% Fractures 10.5% Cuts, lacerations 8.2% Soreness and pain 8.0% Bruises and contusions 7.5% <p>Workers in age group 35-44 years had significantly higher incidence rate of DAFW cases involving sprains strains and tears.</p>

4.2.3. The Top Priority Health Issues for Mothers, Children, and Infants

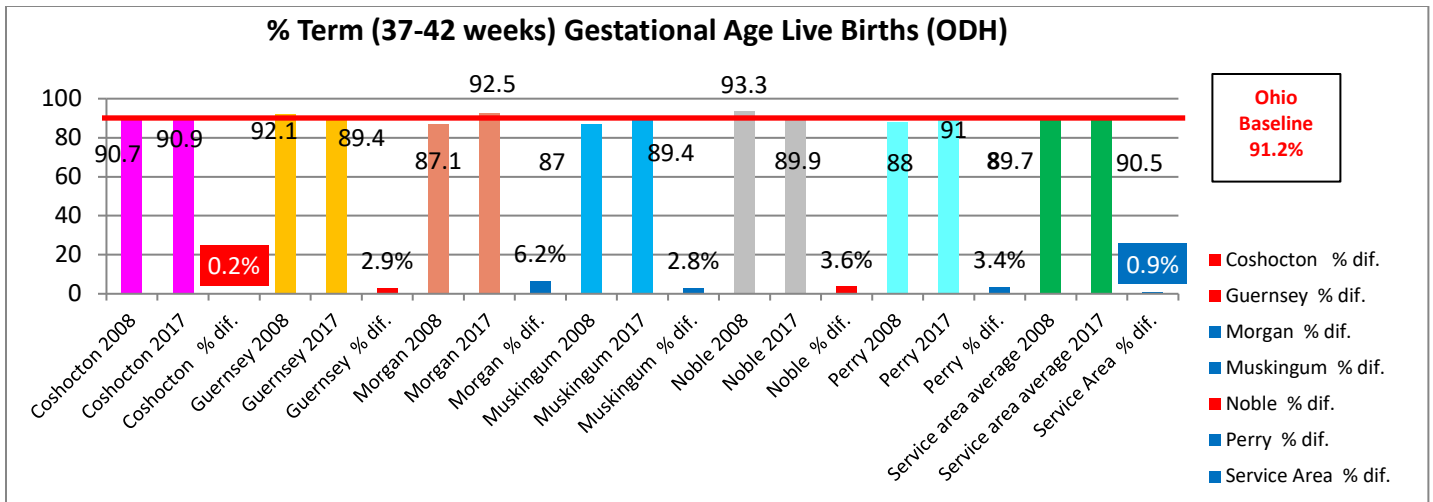

Based on the combined member scores from the prioritization process, the following are the top health issues for mothers, children, and infants.

4.2.3.A. Mothers, Children, and Infants Priority 1: Babies Born Three or More Weeks before It was Due

ODH reported in 2017 that the GHSA had an average of 8% of babies born pre-term at 32-36 weeks, which was similar to Ohio at 8.8% (See chart below).

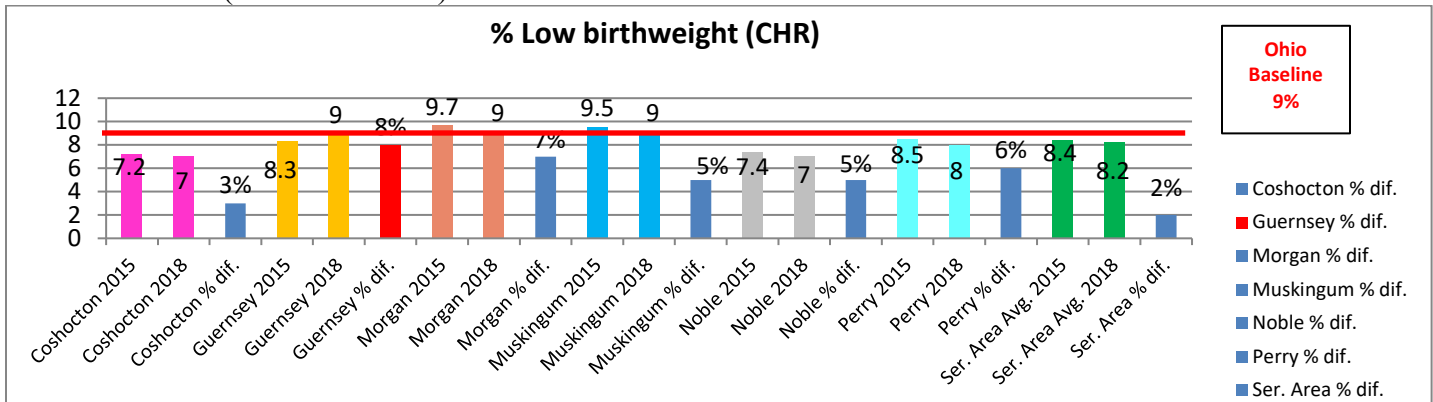

The GHSA had an average of 90.5% of babies born 37-42 weeks which was lower than Ohio at 91.2%, based on reporting in 2017 by ODH (See chart on next page).

4.2.3.B. Mothers, Children, and Infants Priority 2: Low Birth Weight

According to the 2018 CHR, an average of 8.2% of babies had low birthweights in the GHSA which was lower than Ohio at 9% (See chart below).

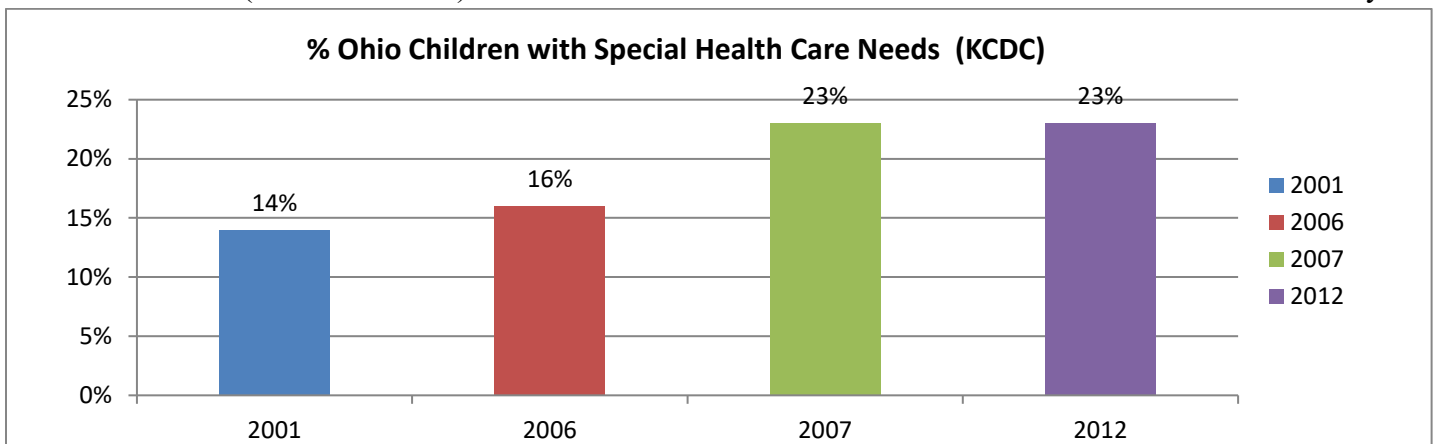

4.2.3.C. Mothers, Children, and Infants Priority 3: Babies Born Addicted

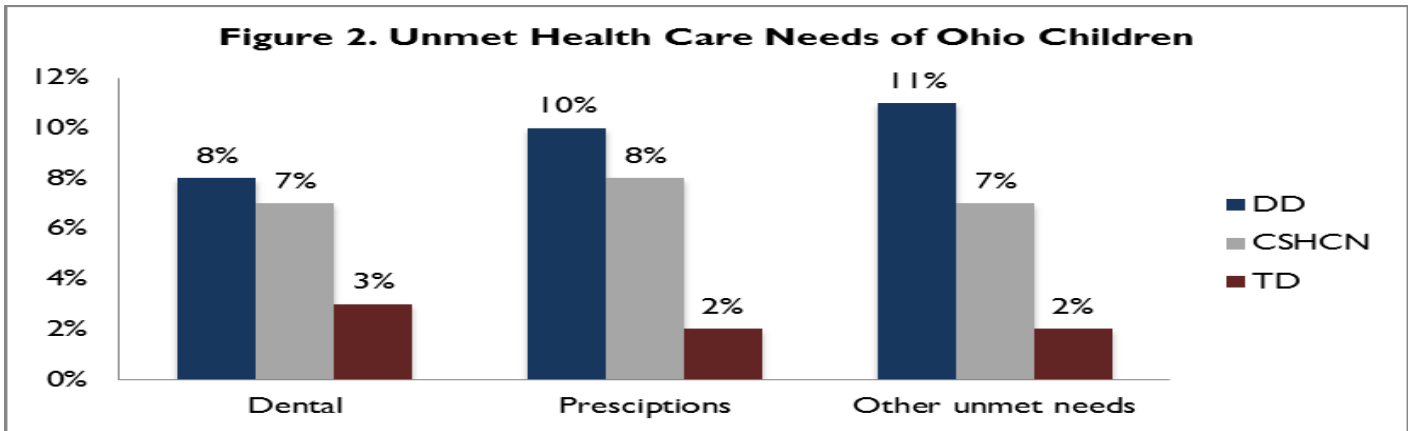

See Neonatal Abstinence Syndrome babies page 30.

4.2.3.C. Mothers, Children, and Infants Priority 4: Children with Disabilities

KCKC reported from 2001-2012 that the percentage of children with special health care needs in Ohio rose from 14% to 23% (See chart below). Local data was needed to assess this burden in the GHSA community.

According to the 2015 Ohio Medicaid Assessment Survey, children in Ohio with developmental delays (DD) and children with special health care needs (CSHCN) had three to five times the unmet health care needs compared to typically developing (TD) children (See chart next page).

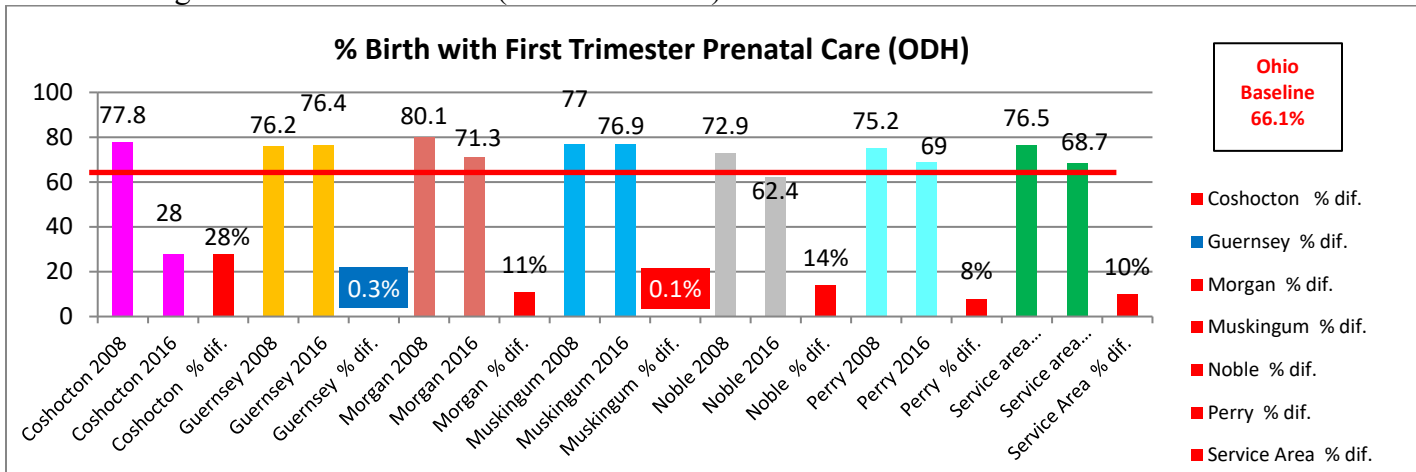

Note 1: Data from Ohio Medicaid Assessment Survey 2015

Note 2: Definitions of DD (developmentally delayed), CSHCN (children with special health care needs), and TD (typical development)

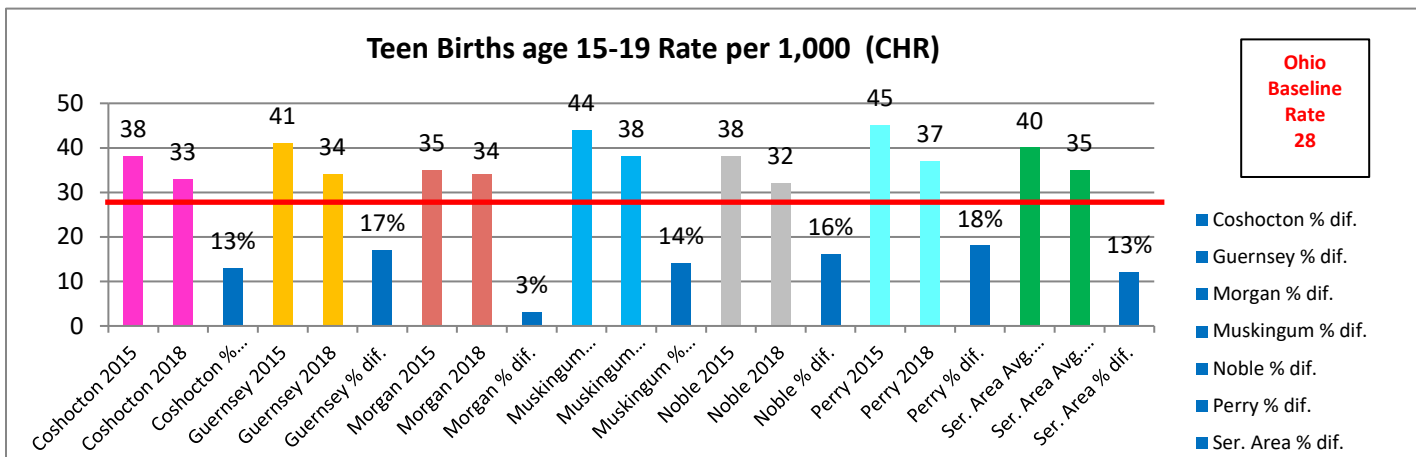

4.2.3.D. Mothers, Children, and Infants Priority 5: First Trimester Prenatal Care

ODH reported in 2016 that an average of 68.7% of births in the GHSA had prenatal care in the first trimester which was higher than Ohio at 66.1% (See chart below).

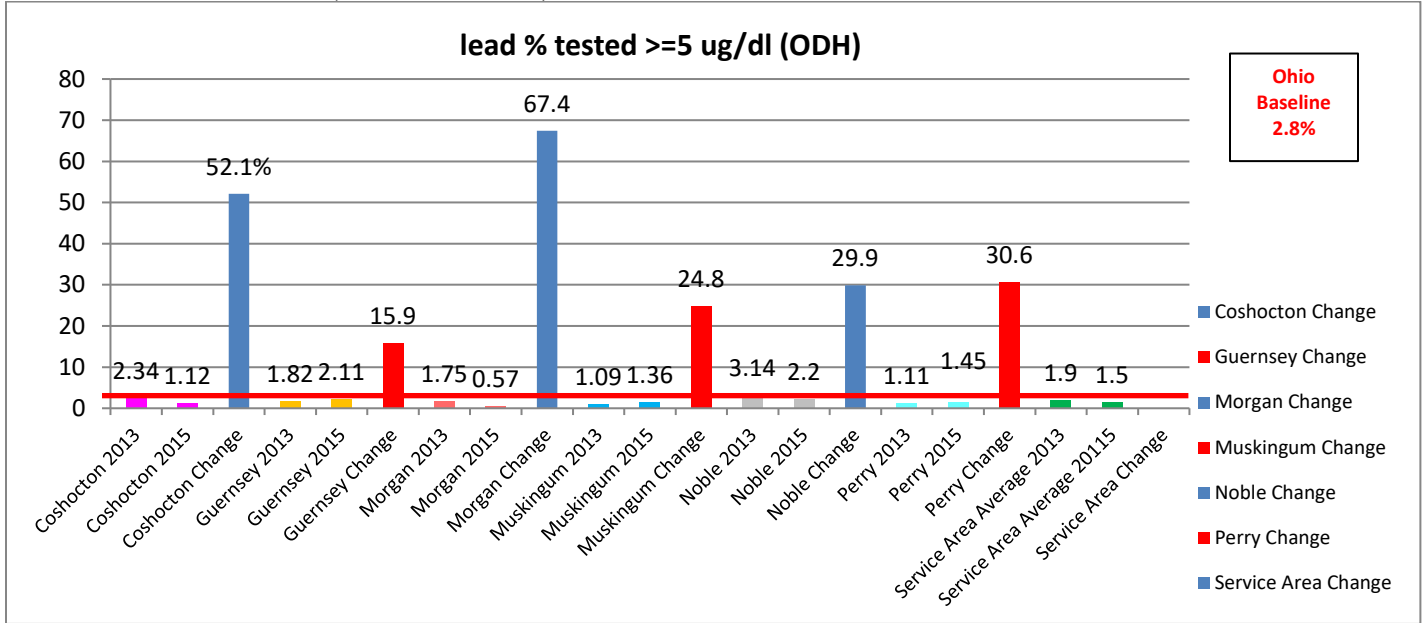

4.2.3.E. Mothers, Children, and Infants Priority 6: Teen Births

Teen birth rates have decreased in the GHSA. Based on the 2018 CHR, the average rate of 35 for teen births ages 15-19 for the GHSA was higher than Ohio at 28 (See chart below).

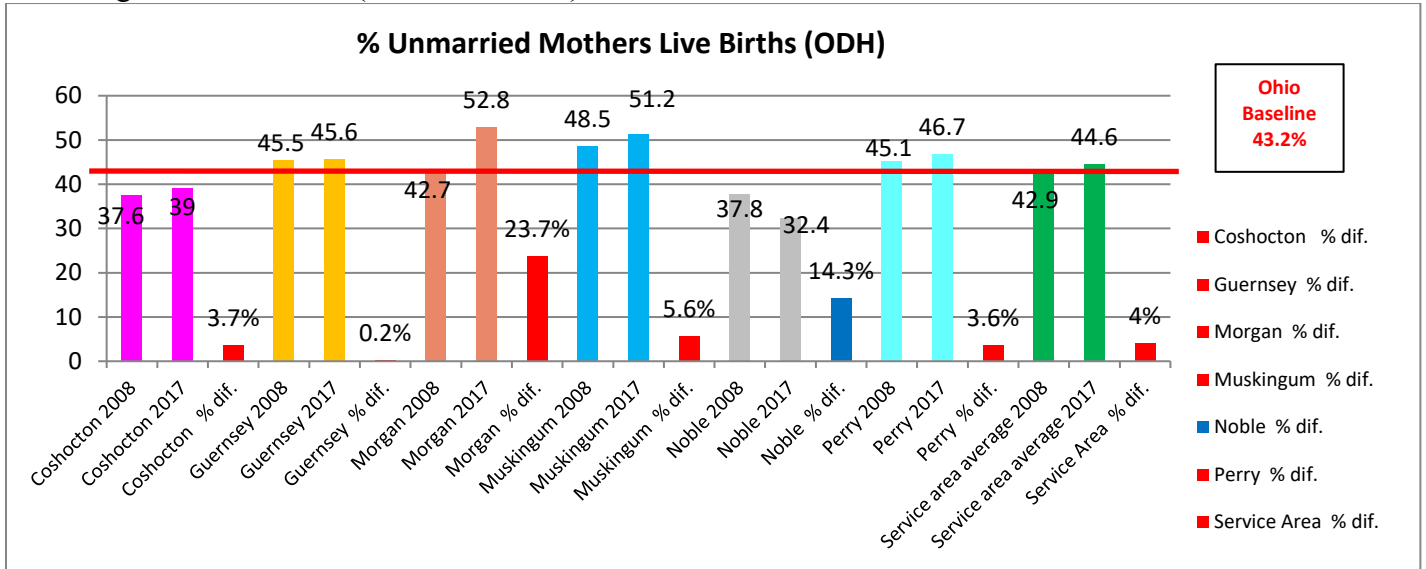

4.2.3. F. Mothers, Children, and Infants Priority 7: Childhood Lead

ODH reported in 2015 that an average of 1.5% of children tested for lead had a value of ≥ 5 ug/dl which was lower than Ohio at 2.8% (See chart below).

4.2.3.G. Mothers, Children, and Infants Priority 8: Unwed Births

The average of unmarried mothers giving live births in the GHSA (44.6%) was higher than Ohio (43.2%) according to ODH in 2017 (See chart below).

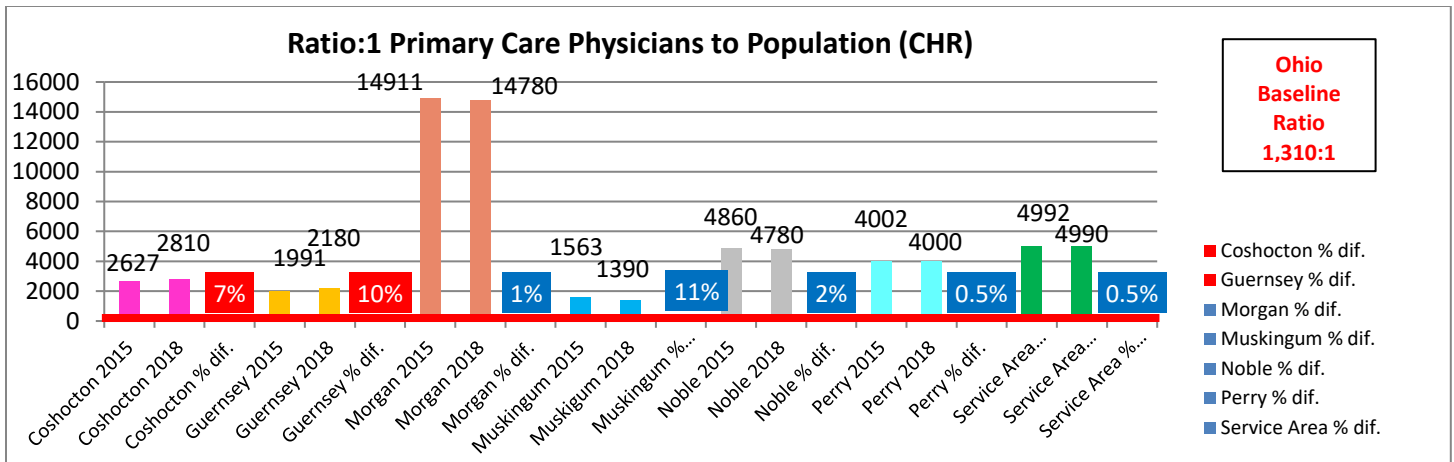

4.2.4. The Top Priority Access to Care Issues

Below are the top issues related to access to care in the GHSA.

4.2.4. A. Access to Primary Care Physician

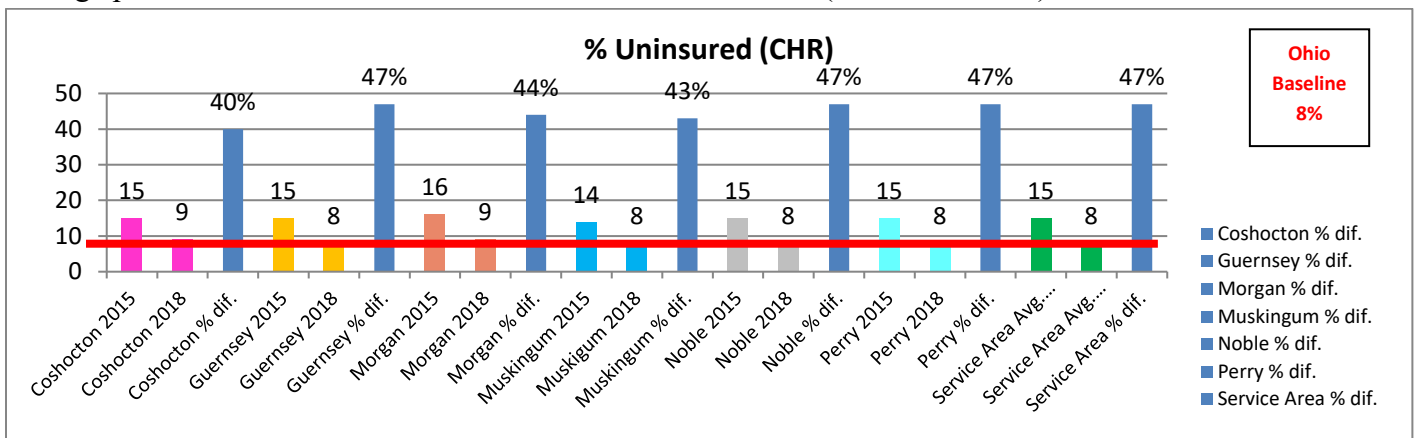

Five of the six counties, all but Muskingum County are designated by HRSA as Primary Care Health Professional Shortage Areas. The chart on the next page revealed the average primary care physician ratio based on the GHSA population was 4,990:1 compared to Ohio at 1,310:1 according to the 2018 CHR. There continues to be an urgent need for more primary care physicians in the GHSA.

4.2.4.B. Access to Health Insurance

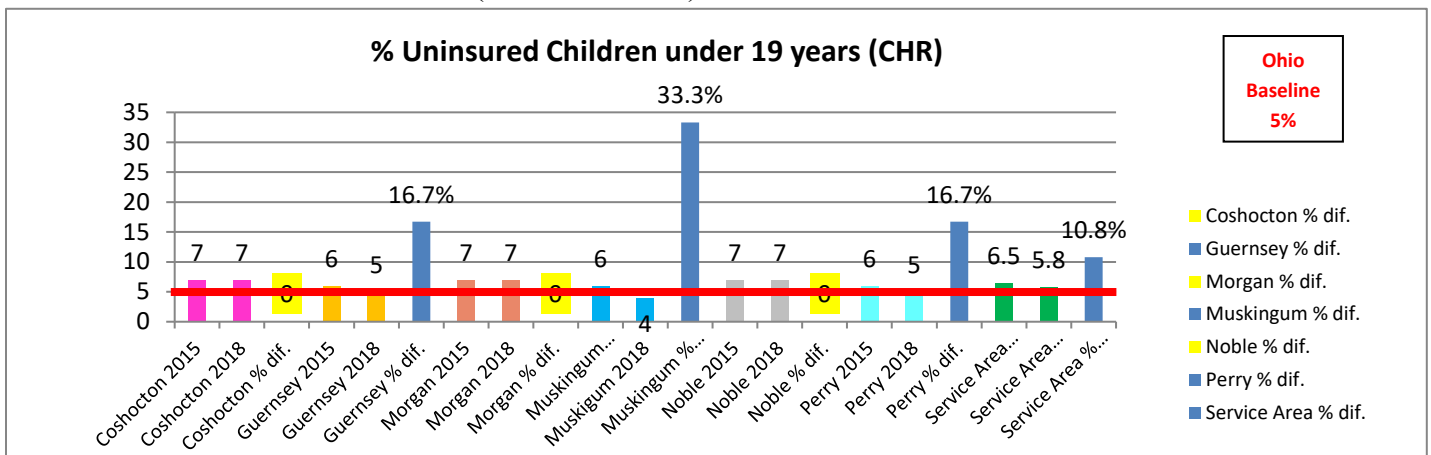

Adults

The GHSA increased Medicaid enrollment for those qualified due to Medicaid expansion in Ohio since 2015. The uninsured rates dropped from an average of 15% to 8% in the GHSA according to the 2018 CHR. The average percent uninsured for the GHSA was the same as Ohio (See chart below).

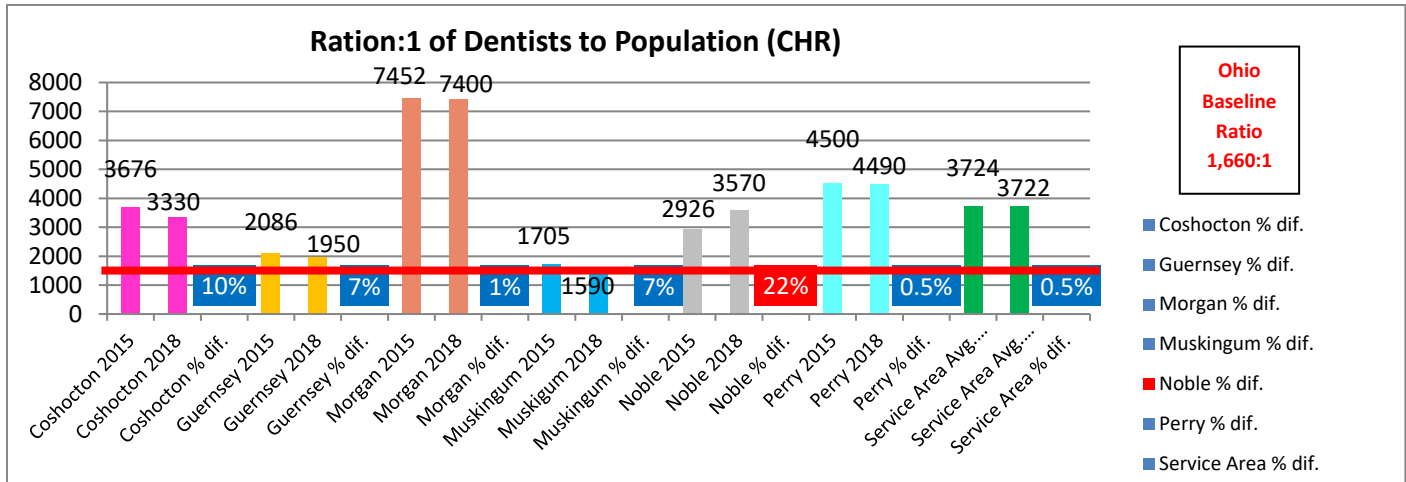

Children

Uninsured children decreased in the GHSA from an average of 6.5% to 5.8%, which was slightly higher than Ohio at 5% based on the 2018 CHR (See chart below).

4.2.4.C. Access to Dental Providers

All six counties are designated by HRSA as Dental Health Professional Shortage Areas. According to the 2018 CHR, the average ratio of population to dental providers for the GHSA was remarkably higher at 3,724:1 when compared to Ohio at 1,660. Lack of dental care, particularly for those living in poverty is directly affected by the available dental providers in the GHSA community (See chart below).

4.2.5. Asset Mapping

Appendix 5.3 provides a listing of county and area resources available to address the priority chronic conditions, risk factors, mother and children issues, and access to care.
